TAPR APRS Special Interest Group Archive, January 2002 through December 2002

January 2002 through December 2002

TAPR's discussion forum for the Automatic Packet Reporting System (APRS), including software, hardware, GPS, mapping, networking, operations, and related technical topics.

This volume contains 7 original monthly files and 5,737 messages, arranged chronologically. The PDF is a readable access copy: MIME transfer encodings are decoded, HTML bodies are converted to plain text, and non-text attachments are represented by descriptive notes. The raw source text is supplied separately with the Internet Archive item.

```
I saw a message earlier about the OnStar GPS units.  Is there anybody out there that has any info on
them?  Wiring, locations in the vehicles, etc?  This sounds like it could be a great source for GPS
units.

Rendered body type: text/plain
```

```
This may have been covered before, but since I've gone back to grad school I
haven't followed the list very closely.

I couldn't find anything on the TAPR archives so I'll ask the group:

Anyone with hands on experience with the Garmin 176C that can answer a few
questions regarding suitability for use with mobile APRS:  I'm thinking about
upgrading from my Garmin III+ in the car:

1) Will the 176C accept waypoints (station locations) from the Kenwood D700?

2) What are the users impressions of the unit.

Might be best to respond directly if this has been covered before.

Thanks in advance.

DE W5KNB
Ken in Jax, FL

Rendered body type: text/plain
```

```
1) Will the 176C accept waypoints (station locations) from the Kenwood D700?

>From Garmin's webpage...

**These units are also able to transfer waypoints, routes, and tracks
between the PC and GPS using MapSourceª.

also...

NMEA In/NMEA Out - supports the input/output of standard NMEA 0183 version
2.3 data, and sonar NMEA Input support for the DPT, MTW and VHW sentences.

I haven't played with a 176, but it sure looks like a nice GPS. Anything
that gives you a larger screen will make the maps look better. Pretty soon
the GPS units will be up to 1024 * 768 at 32K colours.

```
No that was just an example, Wes's page covering Sound Card modems is
VERY complete and step by step. I was hoping that someone who knows
Linux well and knows the Linux Igate program could set up a page with
step by step instructions for those of us who don't know linux but do
want to set up a Igate on Linux.

I want to be able to get the cheapest computer to do the igate so it
can sit in the corner on the floor and just WORK! no re-boots etc.
etc, set and forget. I have a 386 or a 486/P75 which should run Linux
well enough to run the igate. There are hundereds of 386's and Non
Pentium 486's out there now for free. With the advent of DSL
spreating to all parts of the country Igate's should be very easy to
setup.

Google is your friend:

http://www.google.com

Entering   linux ax.25 sound card    comes back with 3000+ hits.
```

A 386 might be a bit weak to run a sound card modem, but a 486
should be fine (but never tried a 386 so who knows?).

6. [aprssig] TAPR blocked

From: Jeff Brenton <jeffb@csrye.org>
Date: Tue, 1 Jan 2002 14:12:31 -0600
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-54518-2002.01.01-14.42.25--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I just lost my connection to TAPR.ORG, because the HFSIG isn't
configured to block non-member access. It seems that it accepted mail
from "teeniesuckathhon3f42v4@msn.com", and someone on the list
forwarded it to SPAMCOP.NET.

Short version: SPAMCOP.NET blacklisted TAPR.ORG because it exceeded
the spam threshhold, and now my system is blocking incoming mail from
it. Since I can't afford to disable SPAMCOP screening, I'll
unsubscribe to keep things from bouncing.

Actually, the sound card tutorial is by Ralph Milnes, KC2RLM. The page
launches inside a frame in your browser, so it looks like it's my work....
and I'd love to claim credit for such a fine tutorial!!

Rendered body type: text/plain

John,

You can use Win/MacAPRS, dosAPRS, or PocketAPRS maps. Place them in any directory or on any sort of external storage (CF, MMC, SD, Microdrive, whatever). When you start APRS/CE, it will search the directory tree (quickly!) for any and all map files. If the program is running when you copy a map file or insert removable storage, select File->Refresh Map List and APRS/CE will re-scan the directory tree for maps.

Hope this helps...

-Rob

9. [aprssig] ADMIN: Happy New Year!

From: Stan Horzepa <stanzepa@earthlink.net>
Date: Tue, 01 Jan 2002 17:24:31 -0500
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-54548-2002.01.01-16.54.35--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

(This message is posted on the APRSSIG on a monthly basis.)

PURPOSE

The purpose of the APRSSIG is to provide a forum for folks interested in discussing APRS, in general. (Other TAPR SIGs are available for discussing specific APRS topics, for example, APRSSAT for APRS satellite applications.)

POSTING MESSAGES

To post messages to the APRSSIG, send email to aprssig@tapr.org

APRSSIG RULES

The APRSSIG has a few simple rules:

. Be courteous. Abusive, insulting, or rude behavior demonstrated towards another list member is a violation of this rule.

. Stick to the subject, i.e., APRS. Subjects that are only tangentially related to APRS (like ³what kind of car should I buy for my APRS tracker?²) may be considered off-topic. If you start a message with ³this is off-topic□² then you are violating this rule.

. Be succinct when composing a message. (The APRSSIG software has been optioned to limit the length of each message.)

. When quoting a previous message, only quote the parts of that message you are referencing. (The APRSSIG software has been optioned to limit the length of a quote.)

. Do not send messages in HTML of Rich Text format.

. Do not send attachments.

. Cross-posting is not permitted. (The APRSSIG software has been optioned to prevent cross-posting.)

. The APRSSIG administrator reserves the right to suspend or ban any list member who violates these rules.

UNSUBSCRIBING

To unsubscribe from the APRSSIG, follow the directions you will find at the bottom of each message you receive from the APRSSIG.

QUESTIONS, COMMENTS, ETC.

If you have any questions, comments, etc. concerning the APRSSIG, please email the APRSSIG administrator at the address below.

That has nothing to do with it.  The reason we are in trouble is because
of the loss of 25% of our power budget in the failure of the -Z panel.
And it is that panel which was the only one which used space rated cells
and which we contracted out for.

> It may be justification to present some midshipmen the opportunity to
> design and build a TT&C package that could take better care of itself,
> for instance.

Nothing can take care of the lack of power in eclipse except more solar
power when we are in sun.

> I work in the satcom field, and god knows I'd love to see space segment be
> less expensive -- but the main reason space-anything is so expensive now
> (aside from launch costs) is because of the stringent reliability and
> redundancy requirements on hardware you deploy and can never touch again.

All of the off-the-shelf commercial items have worked flawlessly.  Only
the hand-assembled contracted out space-rated solar panel did not.

> While PCSat is a fun toy at this point, I wouldn't presume to rely on it
> in any form for the types of "off the beaten path" applications you've

> any safety-related functions.

I dont think it is wise for anyone to depend on HAM radio experimental
payloads for any safety-related functions.  There are plenty of existing
SAR satelites for such purposes that are more reliable.

```
Automatic Voice Relay System (AVRS):

To help prime the pump of interest in IRLP and APRS and AVRS, it might be
useful if some of those APRS nuts on here that are also heavily into IRLP
would indicate their node number so that others can call them while just
out driving around...

SOmething like:

Send an APRS mobile message to him.  If you get an ACK from his mobile,
then IRLP him since you know he is there.  Without targets, its like
shooting in the dark...
```

```
OR!!!  IGates could add something like AVRS to their GATE-TO-RF list.
Then if I am out mobiling and want to chat via AVRS, I just send a message
to AVRS and everyone on the planet with AVRS in their message groups will
get it...

Interested AVRS mobiles need to have AVRS in their D7 and D700 message
groups..

Questions regarding the SIG go to the SIG administrator: wa1lou@tapr.org

18. [aprssig] Re: AVRS and IRLP

From: "Bud Talbot" <kb9wvg@arrl.net>
Date: Wed, 2 Jan 2002 9:32:15
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-54668-2002.01.02-10.01.33--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I use Ilink (rather than IRLP) for voice at home, so for some time I would
include "on Ilink #1347" in my status or data text when my aprs station was
running. It never generated any contacts, but now that we have a local
repeater on Ilink, I was thinking of having "voice SGLS rptrs Ilink #5196"
in the text.

I was also wondering if there might be a way to view the status of the Ilink system via aprs when mobile. On M0CSH web page for Ilink, there's an area that lists all of the stations currently on the system. If you could access that on your aprs terminal, then you could call up a specific station on your local Ilink repeater.

You'll have to forgive me if I've made some gross assumption- I'm relatively new (<2 months) to aprs.

19. [aprssig] New License-Free I-BAND!

From: Bob Bruninga <bruninga@usna.edu>
Date: Wed, 2 Jan 2002 10:36:04 -0500 (EST)
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-54670-2002.01.02-10.05.20--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I modified the suggested I-Band formats a little to put them into pseudo-AX.25 format so that they can be used transparently via any packet system and not just on the internet. Or more importantly, so that existing APRS software can monitor the I-CW HUB and see what is going on. I just figured we may as well use AX.25 for continuity and compatibility for any unseen future applications:

```
CALL>ICWnnn:>Gridsq/$,freq,chirp,weight,decay,tone....
CALL>ICWnnn::TOCALL:Speed,delay,etc,text....
```

The first packet which contains the I-CW's station fixed data and his current operating "frequency" is in APRS Grid Square format so we can plot him if needed for propagation simulation...

The second packet which contains the I-CW's station streaming CW text is placed in an APRS message format so that APRS monitors can watch the QSO's if they want...

ICWnnn is the version number of whatever the ICW software is....

It is NOT intended that any of this will use existing APRS HUBs or networks or channels. They will use a new single ICW hub system.

Here was the original posting if anyone missed it...

---------- Forwarded message ----------

To: TAPR APRS Special Interest Group <aprssig@tapr.org>, amsat-bb@AMSAT.Org
Subject: [amsat-bb] New License-Free I-BAND!

The Novice-I-BAND is a new licensefree virtual Novice band. It is intended to serve as a gathering ground for newcomers learning the Morse Code.

See http://www.ew.usna.edu/~bruninga/i-band.html

I-BAND is a virtual Novice band linked worldwide by the internet. The I-Radio is a virtual radio with all the knobs and slide-rule-dial of a classic HAM radio. You could download your I-Radio from the ARRL BIG-PROJECT office (the school outreach project) and it would come with your unique I-License call letters built in (and tied to you).

You plug your CW-KEY into the serial port (CTS line) and you are on the "air!"... Or use the mouse clicker...

NO, I-Band and the I-Radio do not yet exist... but why not? The APRS worldwide system of HUBS and steaming packets shows how easy it is to do LIVE real-time packet on the internet. Why not CW?

WHY I-BAND?

When I was a kid, the novice bands were full of wonderful bleeps all jammed into a narrow slice of spectrum. It was alive and vibrant...

Last time I checked 80m in the evening, I had to tune for several minutes before I found a novice. This was not encouraging as we try to get kids interested in HAM radio. And the ARRL is receommending eliminating the Novice bands entirely.

But having formed Kids Radio Clubs at my kids Schools and Scout troops, I find that middle-school kids just love to learn the Morse code. Like Hogwarts and Hobbits, its a neat thing... It is the code that fascinates them and sets them apart. I am not a CW fanatic. (See OP-ED June QST 2001. http://www.ew.usna.edu/~bruninga/darth.txt) Its just that now in my 50's that I am concentrating on kids, I find that CW does have an attraction. Kids often are speechless when handed a mic. But CW is a secret code. It doesnt matter what you say, it is new and different and an end in itself.

Why I-BAND? Because as a kid learning the morse code back in 1950's all the kids were exposed to the code (Boy Scouts etc required it). I strung up bits of wire around the neighborhood to form a telegraph system for all us kids to hone our skills.

Today, such attempts would only bring law suits.

I-Radio has *NO* bells and whistles. It has no waterfall display, no text display, and no voice capabilty. It is a CW only rig and is intended that way. But what comes out of its speaker is about as realistic a sound as the Novice bands used to be.

No, I-BAND and the I-Radio do not exist. I dont know how to write that kind of real-time DSP code, but the talent to produce it and the worldwide Internet HUBS developed for APRS show how easy such an application can be. All we need is a coder interested in the future of the hobby and ready for a new challenge to win back the kids of today.

DETAILS: Here are some more specifications on of how this system should be designed:

USER INTERFACE:

```
   Frequency: Sliderule frequency display (not digital) with pointer
   Tuning:    Click and slide the pointer
   Reception: Speaker (hears everything in the passband).
   Sending:   CW Key on CTS line, or click on the key paddle icon
   Setup:     Select the following configuration items.
              Antenna: (dipole, V, long wire, etc)
              Power:   (QRP, up to legal limit)
              Fist:    (defaults to random hashed from your call)
```

XMIT TEXT DISPLAY: The only input device is the CW key. No keyboard input of QSO text should be permitted. But a text display of your outgoing decoded CW is OK as feedback to the quality of your fist.

XMIT BUFFERS: Such as CQ CQ CQ de XXXXX XXXXX are OK, but they can only be loaded by CW Key.

STATION LIST: A list of all stations on the "air" can be available. The list will show calls and frequency and can be sorted either way.

PROTOCOL:

Invisible to the users, data must be exchanged worldwide in near real time so that all copies of the I-Radio generate the proper virtual sounds. This is not done with streaming audio, but synthesized CW at the receiver from fundamental characteristics received via the TCPIP link to the central CW-HUB. There are two kinds of TCPIP data packet. The first contains the fixed information such as frequency, and the second type contains the actual streaming CW text:

```
CALL,freq,chirp,weight,decay,tone.... [sent any time the freq changes]

CALL,spd,delay,text,on-off-bit-data                [sent periodically]
```

On receipt, each I-Radio uses these streaming data packets to produce a realistic virtual sounding reproduction. What comes out of the speaker can be one tone, or dozens, all reproduced in accordance with each one's "transmitted" frequency and the instantaneous setting of the I-Radio receiver. Each fist sounds unique because of the unique settings of the chirp, weight, decay and tone for each user. Chirp is the attack waveform, weight is the weight between mark and space, decay is the

```
decay waveform of each bit, and tone is any second order modulation
on the pure carrier.

Initially each I-Radio is delivered with a random fist but it can be
customized by the user.

On transmission, the senders fist is first decoded locally to give
feedback to the sender, and his frequency, speed, and weight are
determined.  Then the resulting CW text stream is transmitted along with
the characteristic data to allow faithful reproduciotn on the other end.
On receipt, the incoming streaming packets are delayed slightly to assure
continuity and then are used to key the waveform based on all the
previously received parameters.

Just thinking here...  Later we can add propogation and noise models to
each band and eventually could have an unbelievable virtual reality
worldwide ham band!  But I DIGRESS!  For now, we only want a place to
learn and "play" CW!

20. [aprssig] PCsat Resets over Europe

From: Bob Bruninga <bruninga@usna.edu>
Date: Wed, 2 Jan 2002 11:49:33 -0500 (EST)
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-54681-2002.01.02-11.19.03--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

```
PCsat is doing well, but the past few days it seems to be resetting over
Europe even while in the sun.  With the current power budget, it should be
able to handle an average APRS load.

One thing that it *can't* handle is CONNECTS, RETRIES and TIMEOUTS and the
MAIL system.  All it takes is one or two stations to try to CONNECT to
PCsat or to the MAIL box and it will kill PCsat's power budget, and kill
it for the next orbits until it can be reloaded.

I cannot tell if this is happening, because the APRS internet feed only
feeds valid APRS packets.  So has anyone noticed any CONNECT attempts or
other abusive behavior that might explain why PCsat runs out of power over
Europe?

I dont need any callsigns and am not trying to pilorize anyone, just
trying to understand what is happening...  If someone is doing the wrong
thing, politely refer them to the web page below for help in how to use
PCsat...

Rendered body type: text/plain

```
We are preparing to do another PCsat LED test in the next few days and I
have sent an individual Email to all observers who have the equipment to
participate. (That is a precise tracking telescope and camera)...

If you did not get that email AND are capable, and interrested, and in the
Northern Hemisphere, then let me know.  The test must be in
the next few days since we wont get another chance for 2 months or so...

Unless you have special equipment, I would suggest everyone else ignore
this message and this test since it will probably just be a waste of your
time...

25. [aprssig] Cybiko UI Messenger and UI/KISS Driver updated

From: Alex <kr1st@amsat.org>
Date: Wed, 02 Jan 2002 21:00:58 -0500
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-54753-2002.01.02-20.31.47--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Hi there,

There's an updated version available of UI Messenger and the UI/KISS
driver for the Cybiko.

I've added Auto Answer capabilities:

http://www.qsl.net/kr1st/autoans.htm

and I also added capabilities to send KISS-ON and KISS-OFF strings to
the TNC so that the UI/KISS driver can put the TNC in KISS mode:

http://www.qsl.net/kr1st/tnccnf.htm

The main page is at:

http://www.qsl.net/kr1st/

Thanks to all who emailed me with their comments and suggestions! I
really appreciate it.

73s,
--Alex

26. [aprssig] Main application seems to have died terminating thread

From: "Jon Adams" <jon@jonadams.com>
Date: Wed, 2 Jan 2002 19:11:31 -0700
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-54757-2002.01.02-20.41.04--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

After suffering this failure for the umpteenth time in 2001, I finally went
a'searching the archives to see how others had solved this. Unfortunately, I
found only 6 or so messages, all from May-June 2001, about this problem and
with no (apparently) subsequent resolution.
For those of you who may never have seen this error, it goes as follows:
Start WinAPRS (current version 2.5.1, but 2.5.0 and 2.4.9 will do it as
well). in my case, program opens both the gps and the vhf tnc ports, nothing
different in setup for the past 3 years or so.
attempt to send a message. within 30 seconds alert box appears with cryptic
message "main application seems to have died terminating thread" and upon
rooting about find that the serial ports have gone away. must close all
ports and restart each one again. appears to work properly until you try to
send another message then same occurs. however, as tonight, sometimes
attempting to restart one of the serial ports causes a dreaded cold start
reboot of the machine (Sony Vaio SR33). even if this doesn't occur, the
machine gets increasingly wierd and eventually the program becomes very
unreliable.
I have found this "main app terminated..." error to occur under other
conditions, too, not just messaging. I've had it happen when opening a
settings window and dawdling for too long. This is really unacceptable,
especially when it takes down the whole machine.
I have checked this on 3 machines now: the vaio, a parts bin pentium 3
500MHz with 300MB of RAM, and an old dog toshiba MMX166 with 32 MB of ram.
all suffer identically.
What's up? Has everyone else just decided to live with this?

Ok,
Here is the location of most OnStar units. GPS unit is a small
aluminum rectangular box with 1 multipin connector and small coax
connection.

Suburbans & Full size pickups - Under heater box the passenger can
kick the thing!

U/X Vans - Screwed fast to the drivers seat right under handset

Most cars - Bolted up behind rear seat (If you can't find it on a
CAR e-mail me)

Pin out info will be posted here shortly in a JPEG picture format as
soon as I have time to scan. (I think all units are the same)

Ray   ---   Happy New Year!

34. [aprssig] Re: Other Uses for OnStar...

From: James Ewen <jewen@shaw.ca>
Date: Wed, 02 Jan 2002 22:29:51 -0700
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-54787-2002.01.02-23.59.34--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

GM is just implementing ideas stolen from us...

I was having my email read to me over the air about 3 years ago... all with voice activated controls.

Okay, so the voice activated controller was actually Brian, VE6BCA, who played my email back through a text-to-speech program over the local repeater...

Actually, we do have the capabilities to do almost everything OnStar does via APRS. All it is, is a little bit of specialized application software running in the car.

We can use 2 meter or 70 centimeter voice channels for the audio portions that are carried via cellphone for OnStar. We can send email to the vehicle via packet, and have a voice activated computer onboard that could use text-to-speech software to read our email. Have a sensor connected to your airbag system, and when the airbags deploy, the computer could key up the local autopatch, call 911 and tell the operator that you have a boo-boo, and read out the lat/long.

OnStar uses a lot of human intervention to help make the system user friendly. When your airbag deploys, they phone you and ask if you need assistance. If they determine you do need assistance, a human operator determines the proper authority to call, and then converts your lat/long into a human friendly address.

OnStar also makes use of the infrastructure already in place, whereas an amateur system would rely on newly installed local systems.

All of this costs money to implement, and you pay a pretty penny to make use of the fancy toys. Give me a million dollars, and I'll outfit your 1965 Beetle with a totally amateur radio oriented OnStar system. Everything can be done for a price.

The biggest kick in the pants? 10 years ago I used to get raked over the coals for carrying my HT with me... People thought I was some kind of a geek. Now I can wander around with my HT plugged into my GPS and PDA, and no one looks twice. I look like every other techno-dweeb out there. You get goofy looks if you don't carry a cellphone these days.

James

```
Greetings,

For those APRS igates out there that only want to monitor
for APRS frames, and forward them to the internet system,
without getting all of that traffic back, I have a possible
solution for you if you're interested.

I'm looking for BETA testers who are willing to try out
and continue to use the new 'listen only' port running on
my TNOSaprs server/igate, VE4UMR-5.

This port was specifically designed for APRS igates that
want to send stuff to the internet, but not get anything
back. My server has a connection to either first, third,
or orlando at any particular time.

If anyone is interested, please contact me privately.

Sent: Wednesday, January 02, 2002 9:12 PM
To: TAPR APRS Special Interest Group
Subject: [aprssig] Main application seems to have died terminating
thread

After suffering this failure for the umpteenth time in 2001, I finally went
a'searching the archives to see how others had solved this. Unfortunately, I
found only 6 or so messages, all from May-June 2001, about this problem and
with no (apparently) subsequent resolution.
For those of you who may never have seen this error, it goes as follows:
Start WinAPRS (current version 2.5.1, but 2.5.0 and 2.4.9 will do it as
well). in my case, program opens both the gps and the vhf tnc ports, nothing
different in setup for the past 3 years or so.
attempt to send a message. within 30 seconds alert box appears with cryptic
message "main application seems to have died terminating thread" and upon
rooting about find that the serial ports have gone away. must close all
ports and restart each one again. appears to work properly until you try to
send another message then same occurs. however, as tonight, sometimes
attempting to restart one of the serial ports causes a dreaded cold start
reboot of the machine (Sony Vaio SR33). even if this doesn't occur, the
machine gets increasingly wierd and eventually the program becomes very
unreliable.
I have found this "main app terminated..." error to occur under other
conditions, too, not just messaging. I've had it happen when opening a
settings window and dawdling for too long. This is really unacceptable,
especially when it takes down the whole machine.
I have checked this on 3 machines now: the vaio, a parts bin pentium 3
500MHz with 300MB of RAM, and an old dog toshiba MMX166 with 32 MB of ram.
all suffer identically.
What's up? Has everyone else just decided to live with this?

73 - Jon N7UV

43. [aprssig] ZDnet story on wireless LAN software with APRS-like features...

From: WA8LMF2@aol.com
Date: Thu, 3 Jan 2002 16:22:35 EST
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-54932-2002.01.03-15.52.04--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Excerpted from article on Zdnet at:
    http://www.zdnet.com/anchordesk/stories/story/0,10738,2835494,00.html

While I spent the first hour-and-a-half of my latest train ride back to Boston from New York, I popped an Orinoco Silver

http://zdnetshopper.cnet.com/shopping/resellers/0-7085-1411-5684856.html?tag=s

t.sh.sr.pl.pr5684856

wireless network adapter into my Sony PictureBook notebook and launched a clever application called Network Stumbler

http://techupdate.zdnet.com/techupdate/stories/main/0,14179,2783681,00.html

RUNNING IN A BACKGROUND WINDOW, Network Stumbler scans the airwaves for 802.11b wireless activity. If there's an access point or peer adapter within range, it lists it, along with some vital information, such as its Service Set Identifier (SSID) [Are we running so short on acronyms that we have to recycle them ! ? -- wa8lmf] --an identifier that designates a logical network--and whether it uses encryption.

IF YOU HAVE A GLOBAL POSITIONING SYSTEM DEVICE ATTACHED TO THE PC, NETWORK STUMBLER EVEN LISTS DISCOVERED DEVICES' LONGITUDE AND LATITUDE, WHICH YOU CAN THEN PINPOINT ON A MAP USING MAPPING SOFTWARE.

Network Stumbler's results were revealing. I found 79 wireless devices: 76 were access points, and 3 were clients. Of these, only 19 access points had WEP security enabled. That means that, should I have had the time and interest, I could easily have piggybacked onto the others' network connections to get Internet access--in effect, stealing bandwidth. [Free Igates everywhere ! -- WA8LMF] If their internal networks were poorly secured, I could have read and possibly even uploaded files onto their internal clients and servers.

Rendered body type: text/plain

Hey Gunny,

If your KPC3+ has version 8.3 of the firmware, connect the GPS to the 'virtual' serial port that connects to the radio port.

I'd direct you to the online manual, but it only covers up to version 8.2 - http://www.kantronics.com/pdf/KPC3.pdf

I don't have the commands at hand to enable the 'firmware UART' - they've gotta be online someplace though. A quick google search came up blank. Anyone?

If your KPC3+ dosen't have 8.3, then either upgrade it or consider the use of an HSP cable and HSP enabled software.

HSP schematic - http://www.fiberpipe.net/~tateb/hsp.html

Rendered body type: text/plain

I have just started using APRS+SA v2.02 and already understand
a lot of what is being displayed. I do have a question that I
can't seem to figure out. I hope it's not a dumb one. When I
sent out my Position how do I know if it gets out? I looked on
the net on Findu but my call sign is not listed. Does that mean

I am not making it to an Igate? My setting is RELAY,WIDE and I'm
using about 5 watts. Does APRS+SA indicate when my position goes
through a relay like the TH-D7G does when it shows MY Position?
Thanks and sorry if this has been explained before.

Garren

Rendered body type: text/plain

Hi All,
I probably should've clarified this with my first e-mail, but I didn't. So I will now. My idea when I put up AHubSAT, was that all the SatGates could connect to AHubSAT, and that could be our satellite internet server. It's really a decision of the SatGate operators. That was my original idea, and I'm still hoping that it will happen. When I first started AHubSAT, it was not only passing satellite packets, but weather reports, NWS warnings, etc. I fixed this, and now all users receive are packets from various APRS satellites. ISS, PCSAT, STARS, SAPPHIRE, etc. Now all I need is for the SatGate owners to connect to ahubsat.d2g.com port 14580, and we will have live RF data from the satellites. For more information about AHubSAT, or AHubIN, goto: http://www.qsl.net/kb9uqq/AHubIN/AHubIN.html.

Rendered body type: text/plain

This was lifted from the WCA weekly bulletin. Thought it may be of interest
due to our interest in 220mhz for packet. Looks like they cropped off those
high speed packet channels on 219mhz. (we did get those back from UPS
didn't we?)
Wes

FCC Authorizes TDD Spectrum, Providing Boost To Many WCA Members
Proponents of broadband wireless services over TDD technology won a major
victory when the FCC allocated bands in the U.S. TDD (time division

duplexing) is designed to handle traffic bursts associated with data services, such as Internet browsing on a mobile phone. In an order released today, the FCC will allocate 27 MHz in seven bands of government-owned spectrum for the introduction of new wireless technologies and services, including TDD, an air-interface technology that transmits and receives signals over a single frequency band, setting it apart from the FDD (frequency division duplex) protocol used in conventional wireless telephone systems. "This announcement by the FCC is an important step toward encouraging technologies like TDD that require only a relatively small band for bi-directional broadband wireless communications," comments TDD Coalition Chairman Remi Chayer of Harris Corp., who speaks at WCA's Technical Symposium on "The Advantages of TDD Broadband Access Systems" on Jan. 15. "As spectrum becomes more valuable, it is essential that we promote technologies like TDD that use only one channel for both upstream and downstream traffic, making this a particularly effective means of transmitting data in the most efficient way." The FCC's order allocates spectrum from government to commercial use in the following bands: 216-220 MHz, 1390-1395 MHz, 1427-1429 MHz, 1429-1432 MHz, 1432-1435 MHz, 1670-1675 MHz and 2385-2390 MHz. Paragraphs 67 to 71 of the FCC order address the 2385-2390 band that, along with the 2390-2400 MHz band, is being discussed a possible replacement spectrum for MDS 1 and 2/2A. The FCC makes no mention of the possible use of this band for MDS, and the decision anticipates the use of competitive bidding to license the band for flexible uses, noted WCA Counsel Robert Primosch.
In related news, the FCC on Dec. 12 reallocated 48 MHz of spectrum in the lower 700 MHz band (698-746 MHz) to fixed and mobile services. The FCC reclaimed this spectrum for new commercial services for the transition of television broadcasting from analog to digital transmission systems. The order approved for licensing two 6 MHz blocks of unpaired, contiguous spectrum. TDD Coalition member ArrayComm, which has secured a license to deploy the technology in Australia, also praised this FCC's decision. "The allocation of unpaired spectrum is an important step toward bringing new wireless data services to America's consumers," ArrayComm Co-Founder and CEO Martin Cooper told reporters. "Using existing technology, there is simply not enough spectrum available to provide new affordable wireless applications and to continue the expansion of existing services." TDD spectrum has been allocated for data systems in Europe and Japan. The TDD Coalition (a "Supporting Association" for WCA's Symposium) includes as other founding members beside Harris and ArrayComm these other WCA member companies: Aperto Networks, BeamReach Networks, CALY Networks, Clearwire, IPWireless, LinkAir, Malibu Networks, Radiant Networks, Raze Technologies and Wavion.

Sorry,
You would not be able to unlock your car or turn it on via radio remote. Each cell phone/controller for the system is synchronized via a time window and each one is different. GM is the only one that knows that unique time window so remote control via Amateur Radio would be near impossible.

Ray

We actually didn't loose 219-220 MHz ...

FCC Reallocation Retains Amateur Radio's 219-220 MHz Slot

NEWINGTON, CT, Jan 3, 2002--Amateur Radio's secondary allocation at 219-220 MHz remains intact in the wake of an FCC spectrum reallocation of the 216 to 220-MHz band, among others. The FCC declined, however, to go along with ARRL's request to expand amateur access to 216 to 220 MHz. On a brighter note, the Commission potentially relieved spectrum competition for Amateur Radio at 2.3 GHz by making space available elsewhere

APRS+SA v2.02 will announce a digipeated packet with a Morse Code "D". The program by default has Morse Code enabled, and uses a "D" for digipeat. You can change the "D" to anything else you'd like, and enable/disable Code if you wish in Settings, Sounds section.

Subject: [aprssig] Help with APRS+SA

I have just started using APRS+SA v2.02 and already understand a lot of what is being displayed. I do have a question that I can't seem to figure out. I hope it's not a dumb one. When I sent out my Position how do I know if it gets out? I looked on the net on Findu but my call sign is not listed. Does that mean I am not making it to an Igate? My setting is RELAY,WIDE and I'm using about 5 watts. Does APRS+SA indicate when my position goes through a relay like the TH-D7G does when it shows MY Position? Thanks and sorry if this has been explained before.

Garren

Ray:

Actually it wouldn't be that hard to accomplish. A reciever and a DTMF decoder with relay outputs would do the trick. Probably would need to isolate the pulses from the OnStar box with diodes. Now, how to accomplish this task with APRS commands instead of DTMF would be difficult to do (not impossible). Maybe some kind of code in the message text that the on board TNC would decode? But the relay thing is all that existing security systems use. Makes me wonder if you could bash an old car alarm system or retune it for a ham frequency?

What I think would be really cool would be to build an integrated "HamStar" system. GPS, APRS, relay triggers for doors/security, and while we're at it, a HamHUD display unit too! Except for the transciever should be a fairly small footprint.

Now, I'm off to the Ramsey site to look at DTMF decoder units!

Rendered body type: text/plain

Okay, here's what you'd need (I think!)....

Transciever
MIM module, TinyTrak, HamHUD or TNC
GPS
Car alarm w/o door lock interface
DTMF decoder w/ momentary relays
    1- Door
    2- Trunk/Hatch
    3- Interior Light
    4- Headlight Flash/Horn Honk
    5- Siren (Also would trigger "EMERGENCY" APRS beacon

I'm sure I left something out!

With this setup, you would have everything OnStar provides except looonnnng distance unlocking. The DTMF codes wouldn't be used so frequently that they would QRM the APRS freqs. We can already ask each other for help, directions, etc! Should be fairly easy to implement, I would think.

I'd have to take issue with that statement... I can take an off the shelf
KPC-3 and a radio and be able to pop my door locks easily.

Use one of the outputs that can be set via packet (you could even use the
front panel LED output), interfaced appropriately to the door lock relay,
and poof! Instant unlock!

You are limiting yourself by assuming we are trying to imitate an OnStar
code. Trying to tie amateur radio into the OnStar system would be an
exercise in futility. We were talking about duplicating OnStar via Amateur
radio means.... totally feasible

I was at a friend's house. His kid has a Cybiko, with the "Cybiko program loader" always active. (btw...this is the software that loads on a host computer that allows one to download software from the Internet and load it via USB port to the Cybiko)

He was showing me all of the cool Star Trek videos and trailers he could download. When he was done, we looked at his "Shared Folder" (the location where the Captain and Crew's video was stored), only to find a half-dozen "extra" files...all of which were Cybiko related.

No...he didn't expressly download them. They "came along for the ride".

I advised him to not leave them there (none were labeled anything that made any practical sense) for his kid to download to his Cybiko by "mistake".

I'm simply passing along information...it is your choice to digest and act on it. :o)

Last fall I was in a vehicle chasing a manned gas balloon during a long distance gas balloon race that originated in Albuquerque, NM. We were in southwest Kansas when the pilot reported to me that he was being shot at by some idiot. He had the presence of mind to log his GPS position and passed that along to me and requested that I report the incident to the local law enforcement people. I immediately contacted 911 with my cell phone. When I gave the LAt/Long of the incident to the dispacher, she said "I have no idea what you are telling me. That means nothing to me". I asked her to please just log the numbers I gave her for future reference and please send a officer to our ground location which she did.

The point of this is; is it common that 911 personel do not understand Lat/Long? If so, then I fail to see what good it does to report this to them because how are they going to use it to help us?

Well, I guess that is the ole use it or lose it in play.....

Of course, the 216-200 MHz was not primary to us,
so if NTIA wanted to give it away, I don't
think us being a secondary user would have held
a lotta water.

Well, I declare, sounds like another government boondoggle...

If I don't make no mistake, I think the FCC is pushin'
the wireless phone folks to put GPS in the phones
so that the 911 ops will know exactly where you are give or take a 100
meters depending on the kinda conflict that we're in and what DOD does with
the sats.

Hopefully, you ran into one of those EEO type employees and someone there
knows about it.

Yes, the KPC-3+ can have 3 ON/OFF outputs, (door lock, Start Engine, etc)
and it also has 5 analog Telemetry feedback channels (monitor battery
voltage, Temperature, etc).

See  http://www.ew.usna.edu/~bruninga/kpc3-tlm.txt

>> The point of this is; is it common that 911 personel do not understand
Lat/Long? If so, then I fail to see what good it does to report this to
them
because how are they going to use it to help us? <<

It depends.  In my county in NJ it is common for the volunteer rescue or FD
to give the countywide 911 dispatcher GPS coordinates when a medevac
helicopter is requested.  Makes finding the scene easy for the chopper.  A
couple of months ago I reported an accident I came across to the dispatcher
via autopatch by giving a very rough location and the GPS reading off the
D700 screen.  The dispatcher gave the GPS coordinates to the squad (I
listened on the scanner <g>) who then used them to help get to the scene.
Even for a simple breakdown of one's own car in unfamiliar rural territory
the APRS setup can be valuable in helping the police locate you.

64. [aprssig] PCsat over Europe

From: Bob Bruninga <bruninga@usna.edu>
Date: Fri, 4 Jan 2002 10:21:11 -0500 (EST)
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Cc: <amsat-bb@amsat.org>
Message-ID: <LYR842-55160-2002.01.04-09.50.34--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

```
G4FIP sent in a copy of a recent 3 Jan PCSAT high elevation pass over
Europe.  Here are the statistics on the total 67 packets he copied:

Station: Kenwood D700E with dual band "gain" vertical and 50' Mini-8 coax.

Packets:        5| 2|  | 1| 1| 6|11| 7|12|  | 5|  | 9| 9|
time: 10:xx ...57|58|59|00|01|02|03|04|05|06|07|08|09|10|...
Elevation:   0| 6|10|15|20|30|50|70|80|60|40|25|15|10| 5| 0

He estimates he hears about 50% of all packets with this marginal
setup.  A mobile with 10' of coax would do 2 dB better which is a lot
when you are dealing with satellites. Notice the number of packets
```

perfectly matches the antenna pattern of a 5/8ths wave gain antenna with good gain at the horizon and above 45 degrees, but nulls in the 10 to 40 degree range (half of the pass! Thats why 5/8 mobile whips do not do as well as a 19" vertical whip on a car roof).

Here is an analysis of the packets (notice this is weekday working hours) which does seem to support his <50% reception estimate):

```
   6 PCSAT telemetry packets (44% success in the 13 minute pass)
   3 PCsat Bulletins         (probably a 33% success rate)
  58 packets originated by 9 different USERS
```

Of these 58 user packets from 9 users:

```
  16 were CONNECTS/RETRIES/BUSY'S (all caused by one station)
  22 were dupes of one other stn's posit (xmitted in bursts of 4 to 7)
  15 were reasonable packets from 7 reasonable operators
```

So most operators seemed reasonable although 2 consumed 65% of the channel capacity. Of the 7 resonable stations, all got in with multiple duplicate positions and some appear to have been transmitting at a 30 sec rate or so and achieving about a 45% success rate. This suggests that the lower 1 per minute recommended rate would have worked quite well.

Here is an edited log summarizing the statistis:

```
10:57:37R PCSAT-1>:T#553,558,559,560,563,566 [6 successes in 13 mins]
11:02:38R PCSAT-1>:BULLETINS [2 LT1's 5 mins apart & One LT4]

Here is South Carolina Each 911 dispatch center has a Lat/long Map of their
county.  So they will realize after the "duh" delay what you are speaking
of.  Most of the dispatchers call it Grid numbers.

I work for the SC Forestry Commmission and we have trained the county
personel to understand Lat/Lon as this is our primary method of locating
wildfire in the state.

Apparently this is condsidered great sport in this part of the
country.   Here in SoDak a son and MOTHER were just recently given
probation for doing the same (shooting  a manned gas balloon).   A friend
of mine said that just about every time their hot air ballon drifted over a
(Native American) reservation in Arizona, it would draw gunfire...
My personal opinion is that these people are terrorists (an organized group
of people trying to bring down a manned aircraft in flight) and should be
dealt with in the same way.

I would say in most parts of the country, 911 operators do not know where
to send support based on lat/lon.   We've had this discussion before and it
was one of the reasons for the whole mile marker deal...

Hello Bob,

I hope you can identify and remind these individuals personally. Several
users in Europe also have unproto paths via PCsat that do not seem to make
sense and will make their APRS packets bounce on the ground (e.g. WIDE7-7 or
similar).

Without the stupid useres, PCsat would be such a great bird.

Have a Happy New Year

While I think that the indians should not shoot at them
as a general rule.  I guess it begs the question since
reservation land is sorveign indian land.  Did they get
permission to overfly?  Were they over one
of their sacred  grounds?

The indians should have left it to the tribal police
do take action though.

I checked my directories and find nothing unusual. I am behind a firewall so this may affect it.. He may want to make sure he is running the latest versions and make sure his flash is at rev 57.. Both are needed by the UI Messenger application which brings back to APRS related :-) ...

There is no reason to make the loader active all the time, it is only needed for software sync'ing, and can be brought up manually. He should investigate his setup as it sounds unusual. Current versions of all are on the Cybiko website..

I can say that the installers create files out of compressed images which are not directly visible until after install. I have the SDK, but have not run anything at that level to understand it all yet... And I would run a virus scanner real time on the system to watch errant downloads...although these would be I386/win centric, not Cybiko which could be "bugged or virus'ed".

Greetings,

Just curious. If an APRS-PLUS system is connected to a server and does not receive ANYTHING after a particular period of time, will APRS-PLUS terminate the connection and move on to the next one in it's rotation list ?

Is the period of silence configurable ? Can this check be switched off ?

What would the legality of this option be? At that point your car would be
initiating a transmission. Or at minimum adding a line to your
predetermined string.
I'm reminded of a story I read about a Ham that had the alarm at a tower
site trigger a Morse message over the repeater if the site was ever
infiltrated. If I recall correctly he was busted, however I cannot remember
the penalty if any.
How would this differ?

Aaron (KC8CAL)

You might want to check the band plan before you send something like this
out.

1.25 m  is as follows for U.S amateur radio operators:

Voice, CW, MCW, RTTY, data and Image

222.000  to  225.000  MHz

If you were to check up on it you will understand that we have not had
215.000 to 220.000 MHz for a number of years.

Rendered body type: text/plain

Is anyone running APRSd and using the UDP functionality? I am interested
in seeing some example scripts to perhaps glean weather and/or satellite
info off the internet and stream to local rf. Could use some elmering
here. Haven't found very much info on this facet of aprsd.

Thanks in advance.

I did before I sent it to you.

No wonder we live in a panic stricken society.

All of the new hams out there believe every alarm you guys send out.

The people who read your comments probably have no idea what packet is anyway because they are doing good to have an HT with families to support.

Besides, you did not mention 219-220 you said (your words not mine) of course, the 216-220 MHz was not primary to us.
You made it sound like the Commission just came in and grabbed it.

The FCC can not "grab" government (US) frequncies.

NTIA must give them to the FCC.

Of course, since the discussion is about 216-220, that is the range that I was talkin' about...

Make some sense now....

With loss of a connection, or a 120 second period of time with no input , APRS+SA will move the next
server in the list. The period of time currently is not programmable.  I could be made to be very easily
 if that is something people want.  It would probably take 60 seconds of programming time.

Well, I'm not actually all that sure. It would depend on the emergency, I suppose. And it's initiation would hinge on the way ham who installed it set up to trigger. Examples of no problem would be air bag deployment or manual trigger by the ham. Obviously these would fit the bill. However, the thing going off because someone set the motion sensor to sensitive would not! Maybe a 6th I/O would be better. One that would be set up for just the "EMERGENCY" beacons. "5" cold be left to change just the beacon text/beacon time to indicate "problem", without the map-centering, etc. on the other end that APRS does.

You sure made it sound like they do to kd4nfs who sent this to me originally
and is so worried that the 220 HT he just bought is not going to be of any
use to him in the near future.

I am not the person or organization he received it from.
Before sending or resending information you should consider the problems and
anxiety it causes new hams when they receive half facts.

You might be mistaken to be associated with KV4FZ and K1MAN by new hams when
they discover that they received only part of the story.

The format of our maps is openly published.  I will look up the exact
web site..

We also can handle the Palm Pilot's map format, and image files.
However, image files require .geo files to go along with them. (.geo
= geo-reference data). The information on how to do this is in our
on-line documentation also.

We are actively working on some more topo formats, and if you have a
'favorite' type of map data, I would love to know about it and see
what I can do..
```

Let me know what a ".mps" file is and I will look into it..

them
> because how are they going to use it to help us?

Umm, why have a 911 system? There are idiots manning the system as we speak.

I listened to a police chase one day, where the officer in pursuit had been chasing the suspect for 3 hours. His cruiser was nearly out of gas, and he desperately needed to have another cruiser take his place.

The officer was calling out road numbers as he passed through intersections. (Our local roads are number sequentially, increasing in numeric value as you move west, and north, and laid out in a nice even rectangular grid. Not a difficult concept)

The dispatcher had no idea where the pursuit was, and could not help direct any of the 6 other police cruisers in the area towards the pursuit. The 6 other police cruisers attempting to intercept had no idea how to get into an intercept position either.

The problem is that there is a lack of knowledge and training at the dispatch level if they can not understand the information given to them.

With the implementation of our local air ambulance, GPS coordinates are a necessity. I would guess that most areas of the United States have similar air ambulance services...

Besides, this is all an academic exercise... it's not going to happen.
Someone posed a question, and we're playing the "What if" game.

Geez, you guys need to move north of the 49th! We can play to our heart's content without fear of some nasty FCC man hauling us off to jail.

We are allowed to send telemetry without fear!

The above situation is not a car initiated transmission. It is a telemetry string which is triggered by an external event. *I* programmed the TNC to operate this way, which means that *I* initiated the transmission. The transmission was waiting for the proper set of conditions to arise.

If you think this is an illegal transmission, then shut down all of your packet stuff. APRS position reports use an external trigger from a clock! Other stations digipeating through you are external triggers too!

Here's a DTMF decoder that would really well, and at a nice price, too.

http://www.uddle.com/

For GPS units, there's lots of OEM evaluation ones out there with great specs.

http://www.laipac.com has a few excellent ones.

Interfacing into door locks, etc. isn't a problem on most cars. But use Bosch relays. (I used to do mobile security systems in a previous life.)

Of course there's gobs of ways to implement APRS tracking. MIM module, TinyTrack, stand alone TNCs, etc.

I think it could be done for about $200-250, and no annual fees! I think that just may be my summer project...

I believe I have asked this question here before, but in case I haven't...

Map format conversion is all nice and handy, but what about those of us who do not have access to any map data at all... Has anyone written software that can be used to hand draw maps?

Specifically what I would like to be able to do, is scan in a map, and calibrate it (identical to using a .geo enabled scanned map in WinAPRS). Then, I would like to be able to use the mouse to draw vector graphics over top of the scanned map, bascially, creating an APRS line map over top of the scanned map. The line map data would then be able to be saved as a plain old dosAPRS map, or in WinAPRS format, etc.

I would also like to be able to stitch multiple maps drawn using this method together.

Our printed maps are all in the wrong projection to allow us to scan anything covering a decent area around here, and Canadian map data is extremely expensive.

Umm, the whole "sovereign" rights issue is a sham, and Native Americans really have no say in commercial, military, or general aviation navigation. They are US citizens and bound by US law. And don't assume that all those bullets being fired are from Native Americans.   In the case here in SoDak, it wasn't.

Most states have a law stating you can respond to force with a like amount of force. I say if someone is shooting at my aircraft, he is attempting to kill me. IMHO, balloonists should carry high-power scoped rifles and return fire...

\>The indians should have left it to the tribal police
\>do take action though.

I think if someone filed a complaint with the Tribal Police about balloon overflights, they'ed be laughed at.   "We'll send out the tribal airforce to intercept..." BTW, I've flown in the Havasupai Res' leased helicopter...an aged Hughes 500. It's the only indian tribe I know of that maintains an aircraft for tribal use. But given their location in the Grand Canyon, it's about the only way in with heavy loads.

I think we've strayed enough off topic.   I don't how to resolve the issue of emergency dispatch and GPS coordinates. I will comment that most "911" operators are poorly paid and poorly trained, especially in smaller and rural communites, where the use of GPS coordinates becomes more necessary. I used to live in a town in Ohio that didn't have 911 service until about a decade ago...

73,

Mark

Hi James,

I've been using GPS TrackMaker (http://www.gpstm.com/) to do just this. It allows you to calibrate a bitmap file and then draw in your own tracks. The good news is that it is able to save the map file in WinAPRS MAP format. It's a bit labour intensive but I've used this method to create WinAPRS maps for the Saskatoon MS Bike Tour and a street level city map for Saskatoon.

If you want more details feel free to contact me directly.

I take offence of you saying dispatchers are "idiots." I am one for my city. I am also the Training officer for dispatch, and I am a Training officer for patrol officers when they go through our dispatch. I am also a state certified NCIC (our version of CPIC) instructor. All personnel here (SC) go through up to 3 months of training before being by themselves. They have to know how to read a map and they have to ride with patrol officers to know the layout of the system. While yes, I have met dispatchers who are dense, they do not last long in this business. There are times when during a chase, an officer will give out a location that is not on the map. (We only get maps that cover our area, that's government for you.) That can make it extremely hard for dispatch to know the location of the officer. There is a saying that we tell officers: God may know where you are and you may know where you are, but if dispatch doesn't know where you are, you and God better be on go!
!
od terms! This morning another adjacent agency did not know an officer was in trouble until I told them. I found out later on, that the officer got "too busy" to notify dispatch of what was going on. We get very little to no recognition in our business, except by our peers. Our pay is the about the lowest of ALL public safety fields. (Fire, police, EMS.) Yet we put in 12 hour or more days. We take

verbal abuse from our citizens. I am not a "wanna be police officer or firefighter or EMT." I was an EMT/Firefighter until I was injured 10 years ago. I do not know what training Canadian dispatchers get, but I would not call ours as "idiots."

> I take offence of you saying dispatchers are "idiots."

I didn't mean to demean anyone with the above term... I suppose I should have said rather that the dispatchers and police do not know all... how's that?

In a perfect world, all emergency services would have a tracking unit with them, and the dispatcher would be able to play "God". All it would take, would be a quick peek at the map on the screen to know where everyone was.

Like any endeavor, what looks like a well run system on the outside, can look like total chaos from the inside.

Many of the public service events we do work out flawlessly as far as the served agency is concerned. From my point of view as net control, I'd love to take a big stick and whack a few people...

I guess this is more of what I was attempting to say. I couldn't believe how many screw ups took place on one simple pursuit. It doesn't take very much time listening to the local RCMP to realize that they too are human, rather than the all knowing, all seeing agency usually protrayed on TV.

Sorry for any slight towards any of our fine emergency services personel...
Our lives depend on you!

James

James, thanks. Our personal world, along with the rest, have been changed drastically since 9-11 (which was to be the start of Emergency Services Week.)
I hope and pray this year will be better.
Take care and God Bless.

It's rather funny that you mention this.....I was noticing the same thing recently with my Garmin III+....

And, a friend of mine who has a Garmin III (no plus) was having the same problem.

Maybe its the GPS system in general?

Anyone else noticing this stuff?

Hello again all,

I have had a few ask why the name does not match the call, well I got married and had a name change in the past two weeks and the fcc has yet to change the name in the data base. Now, that being said. Can anyone set me in the right direction for a mate in connections for a paccomm pico packet TNC and a Jornada 680/690? I have mated it with a FT-411 from Yeasu but the computer to tnc connection is escaping me. Also, is there a frequency(s)that are used for SSTV? I got a VC-H1 for christmas and have wanted to try it out but have been unable to find a list of safe frequiencies to transmit on. 2m or 70cm would be nice. Email me off the list with the information please.

Thanks for the information in advance.

Cameron Summerhawk.

> clever application called Network Stumbler

Good evening, Stephen et al-
Network Stumbler is indeed a fun tool. I run a home 802.11b network and very
quickly saw how vulnerable i was when i glommed onto NS.  In the past two
weeks of driving to and from work and other venues I've logged well over 250
access points, a few peers, and I'd say that more than 75% are without WEP
(Wireless Encryption Protocol). Many are not apparently tied to the
internet, but there's a few that I can say provided quick and complete
access to the internet. pretty nice if you needed to send an emergency
email, huh??? Here in PHX many of the more modern convenience store and gas
station Circle Ks run an 802.11b network, named "tsunami", which is
apparently used for point of sale and maybe inventory/gas pump stuff.
Haven't figured it out, yet. Trader Joe's markets run TJPOS and TJALL nodes
in each store here. A lot of warehouses and factories in town are running
INTERMEC equipment, and the networks are all called INTERMEC. There are a
pile of access points named "linksys" and "default". Guess folks were in
such a hurry that they never even changed the default network name. The
worst offenders are private parties (homes) but I've found a few businesses
that ought to lock down the system a bit better!!! The worst though are
```

those homes that name their networks using their last name, so they're pretty easy to find since all you've gotta do is look for the name on the mailbox!
However, what I'd really like to see is an expansion of the public access internet that this equipment can provide. I've been toying with the idea of a 10dBi antenna on the roof and maybe even a bidirectional amplifier, might get range exceeding 1/2 mi in all directions. think of how nice it would be if someone put a system of these up on mountain tops with sectorized antennas and secured it for only hams? Pretty cool!!! The stuff works at speeds of at least 30 mph, i'm sure it would work at higher speeds, especially based upon some intersil info i heard last year where they demonstrated 70mph speeds.
Well, maybe I can convince some folks around here to do some experimentation...

73 - jon n7uv

The PicoPacket comes with a female DB-25 to mate with the standard 25-pin male PC serial-port connector common on older PCs. I assume the Journada comes with some sort of serial cable (probably intended to sync it with a PC) terminated with a DB-9 9-pin female plug (so that it will mate with the DB-9 male serial port on modern PCs). You need:
1) to convert from 9 pins to 25 pins
2) a male-male gender changer to mate two female devices together
3) cross-over wiring; i.e. null modem

You can either wire your own cable from a DB-9M connector, a DB-25M connector and some 9-conductor wire, --OR-- get an "AT modem" pigtail (short cable with a male DB-25 and a female DB-9 intended to connect a external modem to the 9-pin serial port of a PC) and a "null modem" with male DB-9s on each end to mate the AT modem cable and the Journada cable. The send/receive data lines should be easy to cross over, but the hand shaking lines (CTS/RTS, DSR, etc) may be a pain since I don't know if the Journada implements a full set of serial port control lines.

There is no standardized freq on VHF/UHF for SSTV. Most activity is on HF on 14.230 or 14.233 USB, 21.340 USB and 28.680 USB. The SSTV calling freqs on 80 and 40 are 3.845 and 7.171 although you practically never hear anyone there.

Since SSTV is frequency-modulated audio, it can pass through any channnel that can pass voice. I have actually used it through voice repeaters several times. If you want someone to send to, you might encourage a friend to get the freeware SSTV program MMSSTV which sends/receives SSTV through a PC sound card. They would only need a connection across the speaker of a transceiver or scanner to receive only. What radio are you going to mate the VC-H1 with? The unit can function as a speaker/mic as well as sending and receiving SSTV.

```
I would recommend that you use an external NTSC video source such as a
digicam with a TV monitor output, or a camcorder instead of the VC-H1's
absolutely awful built-in camera head.   Just pop it off; then you can feed
any NTSC video source into the 3.5mm stereo mini-jack that is exposed.  The
VC-H1's internal scan converter is capable of excellent pics WHEN it is
supplied with quality video signals (which it's own camera head can't produce)
    [WARNING! Connect or disconnect the head or external cable only with the
VC-H1 turned off!!  The tip contact of the stereo miniplug on the removable
head carries 5VDC power for the camera. Shorting this to the sleeve
(ground/common contact) as you plug or unplug WILL blow a minute
surface-mount fuse inside the unit! Idiscovered this the hard way! ]

I run SSTV "mobile LiveCAM" with a VC-H1 and a small Sony digicam on the
dashboard of my car (see my web site for more info).   I am presently working
on a setup that will mate a Mic-E encoder and the VC-H1 so that I can follow
up each SSTV transmission with an APRS position report. Later on I hope to
use a small video title superimposer and a Basic Stamp to superimpose GPS
coords on the transmitted video image.

Ok,
    A clarification of my previous posting.  What I meant was using the
EXISTING OnStar hardware that consists of a cell phone/controller module
and a GPS receiver.  I concede that using a different radio and decoder
you would be able to control door locks, lights, etc.

        Ray

Rendered body type: text/plain

```
My PK-12 will "unprogram" itself every so often and lock up with all the
LEDs lit. It can only be fixed by sending ***** with a PC to initiate the
autobaud routine and reconfiguring it. This is very annoying if a PC isn't
nearby. I have suspected that glitches in the power are doing this. Does
anyone think putting a large capacitor across the DC input would help with
this?
Also, the PK-12 has a mode to send a position string if you ground pin 4.
Has anyone fooled with this? I have thought of putting a pushbutton on the
unit or maybe a 555 timer and a pot for variable timing.
I wrote to Timewave about my old PK-232 and they said the firmware upgrade
for the 232 enables it to be a stand-alone tracker like the PK-12. Has
anyone done this? It doesn't seem very obvious from their website that this
is possible.

It does ??? Mine came with two "RJ" style jacks on the front. Maybe I got an
older (or newer) model ?

```

```
Findu is working great as of two minutes ago for my weather station. I
backed off to wide3-3 about two months ago (for about a month) and even
though I continued to show up on most APRS displays, I did not hit a server
that could take me to findu. I took it back to 7-7 and magically reappeared
on findu... my current URL for findu, if you wish to check me out, is:

http://www.findu.com/cgi-bin/wxpage.cgi?call=w5vex-1&radar=grk&last=120

Due to weather passing through the area I checked it at ten last night three
and six this morning and now with no problems other than a refresh...

Joe Dorn, W5VEX, Belton, Texas

Subject: [aprssig] findu - wx

Whats with the findu.com these days?  I was trying to demostrate weather
reporting
to a local TV weather gal and all weather data on findu is not there for any
station
"no report received in the last 24 hours."  When I look at those stations on
the
air, they have gobs of data.  Has the weather collection ability of findu
been
turned off??

APRSdos has a utility for just that.  It is called MAPFIX40.exe.  It will
draw vector APRSdos maps that WinAPRS and others can use.  It also
interfaces directly to a digitizer tablet for exact reproduction of paper
maps.  But it doesnt do anything with the BMP maps ou wanted this
overlayed over...

Everyone on APRS should file FCC comments suggesting that there are 20,000
HAMs that have been doing this since 1992 using the internationally
recognized AX.25 packet radio protocol.   Any applications on FRS would
benefit from adhereing to this existing compatible protocol.

I mentioned that my student classes would be monitoring the satelites
on Tuesday and Thrusday mornings (East Coast USA).  James asked what I
wanted from users:

> Messages sent to the birds? If so, how would we do that within the
> framework of "using" PCSAT, ISS and Sapphire?  By the way I have NOT
> heard anything from ISS since the crew change over, any comments ?

Me either.  I guess the minimum is for people to just come on the air and
beacon say once a minute with their APRS positin/status and or seeing
others on, send a message or two...  We have asked for Sapphire to
"speak  something" and Sapphire can also be used as a digipeater using the
callsign of KG6 (argh, I dont have it here)...

> Having been a high school physics teacher for 35 years and having used ham
> radio as an intergal part of my program I appreciate your working with the
> schools.  In my semi-retirement is there anything I could help you with in
> this venture ?

Just beacon on the birds during those passes.  The down side of this is
that if a few people come over and just start blasting away with packets
every 10 seconds or as fast as they can like most new users do on ISS,
then no one will get through.  But so far, it seems that in the USA, most
users do it the right way and everyone gets through...

112. [aprssig] New PCsat operations suggestions

From: Bob Bruninga <bruninga@usna.edu>
Date: Sat, 5 Jan 2002 13:18:18 -0500 (EST)
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-55430-2002.01.05-12.47.46--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

```
This email contains three new concepts for PCsat:

1) Since PCSAT-1 still seems to reset back to W3ADO-1 even though we are
no longer in the worst eclipse cycle, and since we are coming in to full
sun, everyone is welcome to digipeat via W3ADO-1 for at least the next two
weeks to 21 Jan.  I will still continue to try to keep it set to PCSAT-1,
but will also  add W3ADO-1 to the UIDIGI list, so that users can use that
uplink as well.  Then We will re-asses where we are going after Jan 21.

2) Over the USA, the uplink to the 144.39 downlink is available for
special applications.  If anyone has any ideas or special events, let us
know.  (Id like to see someone uplink the position of the Olympic torch
```

on every pass for example).

3) We dont know how long PCsat is going to last, and are taking the approach of "use it now". We have made it to this first full sun period but it was sure iffy during December. We will go through another worst case eclipse period in February and April, but if we make it to June, then we get another 2 weeks of full sun and generally better charging overall due to the sun being in the northern hemisphere.

I konw it has been frustrating with the callsign changes, but the solution proposed in #1 above may help. I am at home and wont be able to update the WEB page until Sunday.

See you on the bird!

Rendered body type: text/plain

I finally got my Igate up and operational using WinAPRS. Still interested in doing the Linux version and tried to install DemoLinux this AM with no luck so that will need to wait.

There are so many servers out there now that I am at a loss. I have not followed the threads that closely recently so I have no idea which is the best one to connect to. Currently I am on the Full APRS Feed, should I do something differently ? I have also disabled the incoming feed since I run out of memory in a few moments of connecting and it allows me to have an idea of how the band is on 2M. If my memory fills up in a couple of minutes I can't really see a point in using it.

Thanks,

Who is this and WHY do packets from this station/IGate seem to end up getting through all of the local IGates????

I've noticed packet originating with this call in past week or so getting out on air in the Kansas City region.

The last line is the key Bob! I don't have a digitizer tablet, but using a mouse to draw the vector map over top of the scanned map would work just great.

GPS TrackMaker (http://www.gpstm.com/) does almost exactly what I want. Well, okay it fulfill ALL of the requirements I requested, but there are a few other things I would like to be able to do, but those ideas also need to be implemented into the APRS mapping specifications.

Why are they even bothering with this? What purpose would be served by transmitting GPS position reports on FRS?

Especially considering that the usable range on FRS is about half a mile since FRS wouldn't have the APRS digipeater infrastucture to extend the range. You would probably be able to see the other end of the link visually...

Why are they even bothering with this?  What purpose would be served by
transmitting GPS position reports on FRS?

Especially considering that the usable range on FRS is about half a mile
since FRS wouldn't have the APRS digipeater infrastucture to extend the
range.  You would probably be able to see the other end of the link
visually...

120. [aprssig] Update Pocket APRS maps

From: Henk de Groot <henk.de.groot@hetnet.nl>
Date: Sat, 05 Jan 2002 22:40:47 +0100
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-55446-2002.01.05-16.10.32--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

```
Hello All,

For your information.

I updated my homepage with a new PocketAPRS map for The Alps, covering Switzerland and Austria, also
usable with APRS/CE and Xastir. Nice to take with you when you go on wintersport this winter.

Like other European maps this map is also based on a WinAPRS DCW map as this is the only vector-map
source I have and which is usable.

You can find the new map, with other maps, on:
http://www.homepages.hetnet.nl/~pe1dnn/
(You may have to reload the map if you have a cached copy).
```

Best wishes for 2002! Kind regards,

Henk.

Netstumbler is an intersting tool. A new version is in the works and one
is also on the way for Embedded Windows (aka WinCe, aka Pocket Windows).

http://home.pacbell.net/mariusm/

Even in a fairly small community like Sioux Falls, I have found dozens of
access points.   The Sioux Valley Hospital and Southeast Technical
Institute are but two organizations that have 802.11b networks
implemented. The local airport also has a pay-per access 802.11b
network.   In October I attended the Hamfest in St. Paul and sat in on
the 802.11b conference.   It seems that some corporations are leaving
Internet access open for "public" use and going to some sort of VPN for
secure network operations.

My suggestion is that we start an ESSID naming convention so that people
can figure out whether an Access Point is open to the general public or
not.   Something as simple as making the ESSID of your AP the word "Public"
might suffice.

My experiments with 802.11b continue. And although the Linksys WAP11 has a
few quirks, it sure has a lot of features that will make most "hackers"
happy.   Recently someone figured out the Atmel configuration utility will

allow one to crank-up or dial-down the RF power output of this and similar
AP's.   It can also be done with simple SNMP commands.

http://www.seattlewireless.net/index.cgi/Wap11Hack

http://www.wi2600.org/mediawhore/nf0/wireless/docs/802.11/WAP11/fun_with_the_wap11.txt

http://pasadena.net/aprf/

I have tested the above and it works.

>>Besides, this is all an academic exercise... it's not going to happen. Someone posed a question, and we're playing the "What if" game.

I'm not sure what this comment means - "it's not going to happen."

e911 is happening, all over. My company has the carriers of over 9 million cell phone users sending e911 positions to the associated 911 dispatch centers.

True, most of these dispatch centers only get the lat/long in plain text, because they don't have a GIS mapping system.

And true, even if the 911 dispatch has GIS mapping, our fire departments and police departments don't. Believe it or not, they pretty much still arrive on-scene by driver corporate knowledge.

And true, even if the fire department had a GIS mapping system, the fire trucks and police cruisers don't have GIS mapping systems.

Are we ever going to get there? Yes. Is it expensive? Yes. Is it beneficial? Yes.

Maybe this is an area where we can be of help. RACES/ARES members (or anyone else) could give a short talk at a County OEM meeting or write a short paper which would help them decipher the location. Maybe even give them a couple good web sites they plug the Lat/Lon into and view a map.

My mistake!
Anyway, there is a position right now in FINDU for N3HGB-7 from a couple
test transmissions if anyone wants to look it up.
This is just for fun now, but sometime I would like to experiment with what
a 5 or 10 thousand foot DIGI could do. Might be great for a SAR operation in
difficult terrain.

Reminds me of my PK-232. Walking briskly across the room then touching
something (anything in the room) metal locks up my PK-232. Nearby
lightning locks it up. (Wonderful for WX reporting...) Power glitches
lock it up. Weak memory batteries really lock it up. Sometimes it
forgets the baud rate. Other times it will just drop out of converse
mode for no obvious reason. I actually made a list at one point...

I ran it from battery. I ran it from wall transformer. I ran from wall
transformer on an invertor on a battery. I insulated the
antenna/feedline/radio/tnc from ground. I grounded the
antenna/feedline/radio/tnc. Nothing I tried made any difference.

My solution: I bought a MFJ-1270C and use that for continuous
operation. It's been running flawlessly 24/7 for about 8 months.

I donno, I guess because "its there"..
People said that about APRS 8 years ago too.

I just see no reason for Garmin to go out an invent a non compatible way
to do what we have been doing in HAM radio for 8 years.

> Especially considering that the usable range on FRS is about half a mile

```
I was the liaison operator between the Dallas Police and theWhite Rock
Marathon race held on December 9, 2001 in Dallas, TX. The police car
was equipped with a permanently mounted computer running Windows
2000 as the operating system. It had an application functionally very similar
to the DeLorme Street Atlas program series, although the graphics were
not quite as good. However, it did do real time tracking of the police car
position, and had both pan and zoom controls on the display. The zoom
could get close enough to see the names of individual streets. I had not
seen or heard of any such update to the DPD, but maybe the media did
not consider such an capability to be newsworthy! :-) Since so much
other stuff was going on all the time, I did not get a chance to discuss
the system in any real detail with the police officer driver, but the
GPS/GIS capability is very much there and in daily use by the Dallas
Police Department. Maybe this capability is considerably wider spread
than we are hearing about!

I was very pleased to see this capability in use by the police!

Let me echo the sentiment. Texas E911 mapping is virtually complete, and most municipalities have working GIS implementations *now*. Some have real-time tracking of emergency and public service vehicles, most do not (currently) but the Texas Transportation Insitute looked at APRS as an inspiration to start playing with ideas.

In a number of cities, even if police and fire do not (yet) have GIS pop-ups (and they're being deployed) the local Councils of Government are using GPS and GIS to improve and make really accurate the paper maps the public safety folks use daily.

It's not an academic exercise (he says, from his ivory tower...). It's real. And FWIW, OnStar, while cute, is a consumer tool for some minor applications. APRS and its cogeners are considerably more "real" for this app than OnStar.

Pretty much my sentiment. There have been some clever ways to get around
the rules that restrict the range of FRS. Like the mobile unit has the
radio built into a mag mount antenna. Part 97 pretty much prohibits
amateurs making use of any data from frs. Too bad the amateur market isn't
sufficient to entice Garmin and others manufacture such goodies for
us.--Doug, N0LKK 73

Me too.  This has been an irritating and repetitive problem for me.  Loss of
GPS signal for no apparent reason -- then, a long time (sometimes as long as
an hour) to reacquire a constellation adequate for navigation.

On these occasions, I've checked the USCG site - to determine there were no
system problems.  I have verified with other users they experienced no
difficulties during the same timeframe.  Garmin denies there are any issues
with the III+.

I am skeptical.

I donno. Nothing prohibits us from listening and receiving any data we hear on FRS. And lots of amateurs now consider FRS an important and almost critical element of any emergency communications preparedness.

I've not much to add to this other than maybe a name for the "frequency" used. How about NetaHertz? The abbreviation would then be NHz (which probably means Nano but I dunno).

My appologies if this has already been done.

Rendered body type: text/plain

>From now until Jan 21st, (and later if we can keep the batteries up) PCsat will digipeat via the following UI digi callsigns to make station configuration switching easier between ground APRS use, ISS and PCsat:

RELAY / WIDE / NOCALL / APRSAT / W3ADO-1

- RELAY / WIDE are for compatibility with normal APRS mobile ground users
- NOCALL is for compatibility with the ISS.
- APRSAT is for compatibility with future satellites
- W3ADO-1 is so that it is still usable even if a RESET has occurred.

NOTE-1. Please do not use W3ADO-1 if the telemetry shows 11111111. This means no automatic or unattended use of this path nor manned use until a valid telemetry has been received. Use of the other calls at any time is OK, since they will default to OFF if a reset has occured.

NOTE-2. CONNECTIONS of any kind TO or THROUGH PCsat are not authorized.

NOTE-3. It would sure be nice if ISS used a MYALIAS of "APRSAT" to make mobile operation between PCsat and ISS transparent other than a simple QSY during the pass.

NOTE-4. The B side 144.39 downlink is available for special applications wherever such down link is authorized. Apply for access with details of your event or evolution.

Always keep abreast of PCsat operations via the PCsat web page..

Mine (III+) takes a while to accquire the sats in the morning, but once it has a lock, it works flawlessly all day. I live in an area with a lot of trees overhead for the first few blocks on the way to work, so that explains the long accquisition time.

Other than that, my III+ works perfectly.

> used. How about NetaHertz? The abbreviation would then be NHz...

I like this kind of thinking! I've started using "ICW" as the name too...
(or is this name already used for something else?)

Bill DIaz is already working on the ICW-HUB for the ICW-BAND. Two others have offered to contribute, but neither feels comfortable doing the full DSP sound-card part... so we still need a coding ace... For what it's worth, some others have commented that promoting CW is retrograde.

But remember, I am only interested in the very special case of kids up to the age of about 12 who are unique in their unbiased sometimes fascination with the "secret" code of CW... and just looking for a way to use the internet for code practice between them...

And for kids somewhat closer to each other they can use the Cybikos to send CW to each other, using real airwaves. You can download the CW practice program from the Cybiko web site. I've never tried it myself though.

>I am skeptical.

I had this happen on a couple occasions with my II+ - I was almost ready to send it back to Garmin as it was under warranty at the time. Then I figured out what was going on. The broadcast radio in my van was tuned to 87.7 (TV channel 6 audio) and the local oscillator at that frequency is a subharmonic of the GPS frequencies. LO radiation is bad enough that the GPS can be 3 feet or more from the bc radio and it still clobbers the GPS. It doesn't kill the GPS instantly - takes 30 sec or so. First the reported signal strengths change - some SV's go up, some go down. Then a message pops up. I can't remember exactly what it says - probably something about power-down and re-init, because that's what you have to do to clear the problem. Just changing frequency or turning off the BC radio doesn't fix it.

When I first got the II+ I had a '92 Chevy Astro van with a factory radio/cassette. I now have a '98 Astro, same basic radio, same problem.

Rendered body type: text/plain

```
Good day all.

Why does some of my position reports listed at findu.com show what looks
like a  timestamp (@xxxxxxz) & some do not?

http://www.findu.com/cgi-bin/rawposit.cgi?call=n5eqt-7&start=500&length=500

If it is because I-gates add the timestamp, would someone here post which
versions of I-gate software do & do not add the timestamps. I am interested
in placing an I-gate online somewhere near my APRS forsaken QTH & this is a
feature I would like to include.

Regards,
Ken

I think we would just end up embarrassing amateur radio if we were to do this
and have less of a chance of accomplishing our goals.

I meet Brad Wiseman, director of R&D of Garmin at the DCC in Baltimore MD. I've
also worked with Garmin quite a bit and like the company. Garmin is the driving
force behind this NPRM. There is no way we can force them to use any specific
protocol and petitioning the FCC would be the LAST way one would want to do it. The
best way is to just ask them. Garmin would be a great company to have in our camp.

Honestly, I doubt if they would considering using our APRS atop UI ax.25 frames scheme
for FRS. It is just to inefficient and whine as we might to the FCC, I really don't think they
could force Garmin to do this. But what is the goal anyways? To be able to port these position
reports to APRSSERVE? In my experience with Garmin, they are very open with their protocols
so making a translation "box" shouldn't be an issue... plus they want to build these things
anyway so my guess is the whole HT should be fairly cheap, much cheaper then what we
have.

I had a GPS III which exhibited the same symptoms.

It was still under warranty so I received an RMA from Garmin and had a new
one in a few days.  Haven't had a problem in the 3 years I've had the new
one.

Yes, but all of these departments are realizing that if the permanent hardware/software goes down in the car, the car is put down - quite an asset waste.

It is actually more feasible to implement the data functions on Palm/Pocket PC, and also provide a high-durability (but quickly replaceable) larger touchscreen/keyboard swivel unit on the dash.

Also costly to implement in each car, as the local Lojack folks have discovered.

You can Bluetooth back to the car comms (which does CDPD or packet-over-trunk) or do CDPD right from the PocketPC (foot patrolmen)
. There are prototypes already, somewhat based on what UPS is doing.

I think Bob is right here.

There is NOTHING that prohibits a HAM from taking ANY data from MOST sources and putting it on the air, however if a HAM does that, it is the HAMs responsibility for the data adhering to amateur rules and regs.

There are regs that prohibit certain 'rebroadcast' unless it's from the HAM originally, and it might be an interesting case if a HAM received FRS and 'rebroadcast' it on a HAM frequency. However, making use of data by essentially 'digipeating' it would, from the way 'I' read things
would not be at issue. Other than the HAMs responsibility for the content IF there were text fields involved.

Mike

> to do what we have been doing in HAM radio for 8 years.

I don't know if this is a question, or merely a lament. However, for the moment I will treat it as a question worth thinking about.

The focus of this e-mail is why, if I were Garmin, I might choose a protocol other than AX.25/APRS. Note that these comments are not intended to necessarily suggest that the decisions made by hams weren't the right decision at the time. Rather, they focus why, if I were selecting a location protocol, I might pick something other than APRS.

o I believe that there are at least dozens of location protocols. Most of them, however, are proprietary or unpublished. So while the APRS protocol is documented, it certainly doesn't dominate the location protocol market. I don't believe that it is intuitively obvious that APRS is the only appropriate location for FRS radios.

o APRS assumes the use of the AX.25 protocol. And, the AX.25 protocol is a very strange beast.
  - It assumes (specifies) that stations are identified by 6-character amateur radio calls.
  - It munges together a lot of disparate functions into one protocol: link-layer functions, end-to-end transport layer functions, and source routing functions. True, APRS only uses the datagram portion of AX.25, but anyone reviewing AX.25 for possible use has to wade through all this other stuff. [Again, read my disclaimer. Obviously, AX.25 has made a strong contribution to amateur packet.]
  - It uses synchronous transmission and HDLC framing, which (while I like them in general) may require more processing power or software than Garmin wanted to devote to the problem.

  From the standpoint of protocol design, I think that the best that can be said about AX.25 in this day and age is that it is compatible with a bunch of existing hardware in a very small niche market (again, if you are thinking about FRS radios, rather than packet radio).

o It is entirely possible that the person working on location protocols at Garmin wasn't familiar with APRS. While this doesn't seem likely, these sorts of things do happen, particularly in larger organizations.

o APRS is not, I believe, the protocol that one would design if one started with a blank sheet of paper. For example, it seems to implement some functions in a number of different ways. It also has a number of odd features to ensure compatibility with esoteric equipment (e.g., X1J TNCs).

o Bob, I assume that if Garmin used the "APRS" trademark, that you would expect them to negotiate a license with you and probably expect a per-unit royalty. I suspect that the FRS market is pretty competitive, and that a royalty-free solution would have some advantage.

o The mechanisms for evolving the APRS protocol are unclear.

While the APRS Working Group exists, it is not clear whether it is active. The implications for Garmin of the current APRS standardization process are even less clear. Compared to most protocol standardization activity, the APRS Working Group is pretty closed/secretive/whatever. If I were Garmin, I would be concerned about tying the future of my product to this vague process.

o The APRS specification seems to talk a lot about specific implementations, particularly the Kenwood APRS-compatible units. If I were Garmin, this might make me a bit uneasy (because it is implementation-specific, rather than because it is Kenwood in particular).

o While I am all for protocol compatibility, I doubt that Garmin felt that they would sell very many more FRS radios if they were compatible with existing APRS products.

So, while I believe that APRS is one of the half-a-dozen really interesting activities within amateur radio, I don't think that alone makes a compelling case for Garmin to select APRS as the protocol for use in FRS radios.

So, I don't know if the world is a better place because I tried to answer your question. And, given the circumstances (e.g., a desire for compatibility with hardwired, unmodifiable AX.25 and APRS devices)
I don't know that things could have turned out differently. Nonetheless,
I do think that it is not unreasonable that Garmin might use protocols other than the AX.25/APRS protocols in FRS radios.

Where were you that FRS was that quiet?

The bedlam on FRS here (anywhere in southern Cal) guarantees you couldn't hear anything more than a half mile or a mile or so. (and certainly guarantees that any data burst would be trashed.)
Almost anywhere around here in the mountains of Califonia (that potentially could yield the 50-80-mile long shot) overlooks these crowded metro areas and hears wall-to-wall QRM, either from the coast or the populated central valley

(I once worked a sixty mile shot from a mtn-top comm site to Garden Grove, CA [aka "Little Saigon, USA"] full quieting with an Icom 211 padded down to 1 mW into a 1/4-wave whip so I know low ERP can do it if it's now being buried in a million other signals...)

Exactly what happened to me.  I have a (home-built) radio coverage mapping
survey system that uses GPS. When I run it in my own car, it works perfecly.
One time when I tried to use it in an L.A. County Sheriff's card, the
Magellan AIV-10 OEM GPS assembly would take forever to lock and would keep
popping out of lock.
    I just happened to turn off the GE UHF mobile rig in the car and the GPS
instantly started working perfectly.    I checked with a microwave spectrun
analyzer and discovered the trunk-mount transceiver was leaking 3rd-harmonic
energy of the UHF RX local oscillator (which lands directly on the 1575MHz
GPS frequency for the LASD freqs in the 483-486 MHz range) at a level of
-80dBm into a quarter-wave whip a yard away from the case!
   It was completely smothering the -140-something dBm GPS signal from space!
 GPS is completely unusable within about 15 feet of any LASD black and white.
 This is one of the reasons LASD doesn't have GPS-based AVL yet -- it has to
wait until 3000 of these crappy GE radios are retired.

When I had a Magellan Meridian XL it would often lose lock as I passed Luke
Air Force base on Northern Avenue.   Perhaps it had something to do with
those phased array radar antennas by the side of the road.   ;)

Rendered body type: text/plain

I was in RS this afternoon and found a new item that may be of use to APRSers, especially those that are tired of struggling to get at the soundcard jacks behind their computer.

P/N 26-204 Computer Headphone Speaker Switch. $14.99

It allows you to switch between speakers and a head set with one button, plus it has a pass-through for a microphone or line in. The really neat feature is a 3.5mm jack for standard telephone headset/mic combos.

They also have the dual trunking Pro-92 handheld scanner on sale.

>

I've definitely noticed this in the congested metro L.A. area. All the external active- antenna GPS units get blasted. desensitized and blocked as I drive by the numerous 1.8GHz PCS cell sites that now dot Los Angeles. The patch antennas are low-Q broadband devices that provide nearly zero selectivity to out-of-band signals before the 15-20 dB gain amps.

My inexpensive "GPS mouse" combination receiver/antenna units (Delorme Earthmate, RandMcNally, Pharos I-GPS180, and especially the Holux GM200) sitting on the dash inside the car are far outperfoming the external antenna units. All of these devices have in common, passive patch antennas connected directly to the receiver front end; i.e much better receiver gain distribution.

I am currently using a unit that combines the best of both -- the Tri-M Engineering "Smart Skymaster". This is a hardmount combination antenna and receiver barely larger than the typical round patch antenna alone -- about 2.5" diameter and about 5/8" thick with a 3/4"-dia threaded stud sticking out of the bottom. It mounts though a single 3/4" hole on the car's sheetmetal with a nylon nut screwed on from below. In the center of the mounting stud is a mini-din connector that you feed DC power into and take RS-232 data out of.

You can see a pic of it on the APRS page of my website at:

My Garmin III+ has never been turned off in almost 3 years (one of the first
ones out).  I use a little mag mount Trimble antenna that Paccom used to sell
for $65.00.

Even receives 6-8 sats while parked inside the garage with the metal garage
door closed!  (Active antenna sure helps!)

Do you have the latest software update from Garmin's web site.  Might help.

One point also being missed is that Garmin will use Bell 202 audio tones. Garmin's
other AVL unit is the NAVTALK which uses touchtone's over the cellular AMPS network
to send AVL position.

I'd not guess they would go that route on FRS, but I also question if they would use
Bell 202. The standard for "through the mic" radio data seems to be MSK, either 1200
or 2400bps. This is what ACARS uses and it offers about 10db better BER performance then
Bell 202 does. Even more likely, both from a performace and cost standpoint, in particular
if it is a integrated unit, is that they would go with some form of direct FSK/GMSK baseband
modulation.

Let me try this again, I meant to send a question to the SIG.

I'd like to command my VC-H1 to digitize and image and then send
it over the radio.  I was given notes on the command structure.
Then I built a TTL to RS232 level converter.  I programmed a Basic
Stamp to send the commands, but only suceeded in getting the
screen to blank out.

Has anyone suceeded in using a terminal program to command a
VC-H1 to capture an image and then transmit it?

Hi Andrew,

1. Yes - At least there is a Command to enter Kiss in the manual,
page 45
2. Yes - According to the manual page 42.

I have not used the Kiss mode at all, but I do have DIGI On and
use it for my D7 when the need arises..

73!

Seems I remember that the VCH-1 has to be hooked to the TH-D7 for remote
control to work.  I looked at it a long time ago, and I think that the D7
converts the received CTCSS I think it was to serial data, and it
was the serial data that then caused that function.  But in re-reading
your email it seems that that is the approach you are taking... so ignore
this...

Subject: [aprssig] $10 USB to Serial adaptor

Found at CompUSA. $10.00 after rebates. iConcepts
PDA USB adaptor SKU#284605. Sale end 05 JAN 2001.

Results from N4TCW Labs:

Tests used using Compaq 1600 laptop running Windows 98
SE w/a Belkin 4-port hub. Could not check voltage
levels to confirm true RS232.

1. KPC3 V6.0 OK at 4800 and 9600 w/WinAPRS 2.49
2. D7A(G) OK w/ WinAPRS 2.49
3. Garmin GPS3+ upload and download waypoints and
tracks w/StreetAtlas 9.0
4. Garmin Etrex upload and download waypoints and
tracks w/StreetAtlas 9.0

Could not test w/TinyTrak I because TinyTrak Config

only goes up to COM 4. The driver seems to set the
adaptor to COM 5.

Lee N4TCW

http://cad.chp.ca.gov/

Shows traffic "incidents" that CHP is working in real time... accidents and other "incidents".... the mapping is rough.. but actually FAR FAR better than some of the "dumber" APRS mapping applications....

Might make for an interesting background on some APRS maps... you get to see the accidents as they are reported as a background to UI Frame position reports....

Over time... could even see what roads have the majority of traffic "incidents" to help avoid...

Imagine... some folks here use NEXRAD radar maps as background... travelers in an area might want to know traffic info as background.... way kewl....

```
This text-based information is already being presented online in an APRS-like
map display.  Check out this site:
     http://traffic.tann.net/Frame05.html

Click on the "LA Regionwide" or "LA Central" links for the best view

TANN (Traffic Advisory News Network) combines the CHP (Cal Highway Patrol)
accident reports and vehicle speed reports provided by Caltrans (Cal Dept of
Transportation) gathered from thousands of sensors in the southern Cal
freeway system pavement to give a color-coded real-time (updated once a
minute) presentation of traffic flow all over the greater LA area.

The map also includes camera icons on the map  linked to live Realplayer
webcams viewing some of the major freeway interchanges.

NOTE: At the time I write this, the freeway speed sensor feed seems to be
down -- normally you will see a rainbow double row (East and Westbound or
North and Southbound are plotted separately) of green, yellow and red dots
lining all of the freeway system showing the speed at each point.

Actually, I have thought for some time this would make a neat enhancement for
APRS in large metro areas -- plot mobiles on the map as color-coded arrows
based on their speed and direction.   There are enough mobiles moving around
at one time in places like LA, Seattle, Chicagol, NY etc that I think a
useful amount of info would appear on the map.    Perhaps an enhancement for
Findu too....

Rendered body type: text/plain

```
I got my Doppler DF box working!  It's the Montreal DF box.  It has the
capability to send DF info to an APRS program.

I brought up WinAPRS and set it up to recognize the DF on port 2.  When
I push the button to send a bearing, WinAPRS draws a line from the
current position.  COOL!  But whenever you zoom or scroll, the line
disappears!  I expected it to at least work like manually drawing a DF
line that would stay there when you scroll and zoom.  OK, so much for
WinAPRS - the maps are out of date anyway.

Next I tried APRS+SA.  I can't seem to find any reference to it
recognizing the DF output.  I guess I'm out of luck there too.
```

Last I tried DOS APRS. I couldn't figure out how to set up DF. I did
alt-S / DF / then tried all the choices. But I didn't see any way to
set the serial port. Besides, the DOS maps aren't really detailed
enough to be a lot of help for fox hunting.

So it looks like I'm out of luck for using the cool DF box with APRS
unless someone has some suggestions.

Skip,

Which one did you build? The one with the LEDs, or the one with the digital
display?

I don't know anything about the interface problem, but I am interested in
your experiences in building it and what your eventual solution is.

Jack KE4LWT

When you start APRS fresh, you indicate that your second comm port will be
used for DF. If you have saved a config file, then do alt-S-PORTS to go
through the port setup again to change your answer to that question.

> Besides, the DOS maps aren't really detailed enough to be a lot of
> help for fox hunting.

SOmewhat true but in many cases you dont need great maps if you have DF
equip because you can just follow the vectors and your nose.. (assuming
you have some general knowledge of the area) But in any case, APRSdos has
some great DF features:

1) The Bearing line stays on all screens and its length is proportional to
the map used for the track. Thus, if you are looking on the 32 mile range
scale, then the line will be about that long (it assumes you wouldnt be on
the 32 mile screen unless you expected the fox to be there. Thus as you
zoom in as you get closer, then everyone else sees your transmited bearing
lines getting shorter.

2) You can hit INPUT-Save MY DF and it will keep a previous bearing line
ont he map as you continnnue to move. Great for the mobile fox hunter for

doing your own trinagulating.

3) APRSdos has omni-DFing that works perfectly with NO DF equipment and even with POOR maps. That is because it only indicates a broad area. probably a few miles across where the fox might be, so map detail is not important. But then take that area location over to your detail maps elsewhere and proceed to nail the guy.

Here is what I poseted before about APRSdos OMNI-DFing. Also I now have a WEB page that shows what OMNI DFing looks like:

http://www.ew.usna.edu/~bruninga/dfing.html

Most new APRS people are not aware of the very powerful APRS "OMNI" direction finding technique that is built into APRS. Today we have a jamming signal on 145.09 in the DC area...

APRS will plot a circle around all OMNI DF reportig stations whose size and color brightness is *inversly* proportional to their received signal strength heard. But the real power comes from the fact that most people hear nothing yet this is EXCELLENT data. Their reports result in large BLACK circles showing everywhere the signal ISN'T!

The overlapping black and colored circles on the map then give a very visual result that locates the signal to be the brightest colored area left on the map. To see an example, if you have APRSdos, do a FILES-LOAD-DF-OMNI and then hit MAPS-PLOTS-DF-OMNI to see a plot of one of our fox hunts...

The relative size of these circles is also proportional to each stations PHG, so the differences between base stations, Mobiles and HT's is accounted for. We have used this technique during fox hunts and always been able to locate the fox to within about a MILE in only a few minutes. No, we cannot do much better, but by locating the neighborhood within minutes, then we can tell the mobile DF'ers exactly where to go immediately to nail him.

The POWER of this technique is at least 3 orders of magnitude better than BEAMS for many reasons.
1) EVERYONE contributes data. Not just the 1% who have beams
2) Those who DONT HEAR ANYTHING contribute very VALUABLE data
3) You can do it immediately within seconds of listening, and no one needs any special equipment. Just make your VOICE report to someone with APRS.
4) Every MOBILE, HT, anyone on the air can contribute. Actually you will spend more time trying to tell them to QSY and just tell you what they heard, then it takes to collect the data!

This was one of the first real advantages of APRS as a graphical map tool, and it used to be quite useful... yet I never hear of anyone using it these days.

In APRSdos, here are the related commands:

INPUT-DF	to report your own omni-DF report
INPUT-ADD-OBJ	(choose the DF icon) to report for someone else
MAPS-PLOTS-DF	to see the result...

For those realy into DFing, there is also a single-driver-omni-FADE technique also built into APRSdos. ANyone with a moble can find ANY jammer alone... if you have the time and the gas... here is how:

1) Drive till you loose the signal. Hit F5 (it marks the spot)
2) Drive back the otehr way until you again lose the sigal, hit F5
3) Turn and go a different direction to find a third point where you lose the signal. Hit F5.
4) Now hit MAPS-PLOTS-DF-FADE. APRSdos will compute the centroid of your three points and plot that location on the map.
5) DRIVE there. Reduce your RECEIVER sensitivity and repeat all steps.

There are many ways to reduce your receiver sensitivity in step 5 between runs:

1) Remove your antenna whip
2) Insert attenuators
3) Use an HT with a rubber ductk
4) Instead of using the 0-signal fade point as your bench mark, use the radio's signal strength at some fixed level.

```
Whereas the OMNI-DF technique is a collective process letting EVERYONE
contribute using any radio and any PHG, the OMNI-FADE technique is an
individual process using only one receiver...  (It is what the CAP uses
in airborne search an rescue)

This is the response to an ECHO command setting from a TNC ECHO command.
Someone has their radio set to ECHO ON, and thus, when configuration of the
TNC is being done, the responses are comming back and the software is sending
them out the IGATE feed, as is.

This happens sometimes when a program is sending commands to a
tnc while the tnc is still in "CONVERSE" mode. The TNC INIT files
usually include the command, ECHO OFF, and the tnc will respond,
ECHO was OFF...

Hopefully, it only happens occasionally when someone is booting
up or changing something and sending the init string to the tnc.
When it won't respond, the operator will probably figure it out..

73,

Robbie

Sounds like the dual port problem again -- could be that APRSplus is ignoring
the receive stream from the side of the TNC you are trying to use. Is
APRSplus set to the dual-port mode and to the correct port for RX?

Maiko,
The ECHO OFF and other related TNC commands and responses should not be passed to the APRS IS but some applications will pass anything seen on the serial port.

APRServe, AHub, and aprsd 2.2.x will reject these packets. Other versions of aprsd may pass the text exactly as submitted. It is possible to see quite a bit of non-APRS data when connected to some aprsd versions.

188. [aprssig] APRIL OKC Marathon and APRS

From: "WL7FT" <wl7ft@mmcable.com>
Date: Wed, 9 Jan 2002 07:03:50 -0600
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-56018-2002.01.08-19.34.09--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Greetings,

My name is Mark Hamblin, My Call is WL7FT. I have been active in PACKET for quite some time (both VHF and HF) and am just getting into APRS. I am also the president of the Oklahoma City Autopatch Assoc. (OCAPA).

If someone will take a moment to help, I'd like to ask a few questions (As yet not being well versed in APRS).

Has anyone ever "done a marathon" with ARPS before? I was the communications coordinator for the Oklahoma City (Murrah) Marathon last year. What we did was all voice (without APRS). I can readily see the advantages of having ARPS aid in the Command and control of this event. I have enlisted the support of several APRS guys here in OKC to get APRS "on the map" and show the marathon and control SAG vehicles during the marathon. Some of my initial questions are listed below:

1. I would like someone to tell me which APRS program is preferred (UI-VIEW or WINAPRS are ones that come to mind). I am creating maps, and would like to move points on the map (relay exchange points, water stops, AID locations etc..) without much difficulty during the race. Being able to beacon their location is not required. The points I would like to beacon requiring mobile APRS would be the SAG vehicles, lead vehicle and the like that would require about ten APRS units and Transmitters. The rest of the points may be "static" points that do not require beaconing, but just dynamic "ID's" on the map that may be changed either by changing a table of points, or moving the simbology.

Personal questions:

2. POCKET APRS for the Mindspring PDA: I have a Mindspring Visor "Neon". Does the serial cable from the "Visor" send INPUT/OUTPUT from the Magellan GPS (the GPS internal to the VISOR) out to the tiny track or like unit And what would the pin-outs be to wire it?

3. Is the internal Magellan GPS unit the best way to go, or would I be better suited to go with an external GPS unit?

If there is someone out there that would like to discuss this with me. I'd be happy to call or go offline private email.

Many Thanks and 73
Mark/WL7FT

Rendered body type: text/plain

Garmin has announced 2 GPS/FRS radios.

http://www.garmin.com/products/rino/index.html

There is no details on the data communications protocol but it seems that it may be proprietary.

191. [aprssig] Re: AVRS and IRLP

From: Bob Bruninga <bruninga@usna.edu>
Date: Tue, 8 Jan 2002 23:38:44 -0500 (EST)
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Cc: <irlp@irlp.net>
Message-ID: <LYR842-56047-2002.01.08-23.08.19--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Adding another idea to the APRS support for IRLP/I-link:

Ideas so far:
1) Add the AVRS.POS file to your mobile APRS for instant map access
2) Putting your local node number in your mobile status text
3) Add AVRS as a MSG-GRP call so you can get general msgs to AVRS
4) Add AVRS to your local IGate to pass these msgs to you
5) Putting your local IRLP node coverage on the APRS map by adding it as an APRS object in the LText buffer in your local APRS digi

New ideas:

1) Someone write an AVRS info engine that will respond to Queries anywhere in the world with the NODE number of the nearest node to callsign X and the distance.

```
Query APRS message:    TO: W3XYZ  MSG: ?AVRS
AVRS Engine response:  TO: mycall MSG: #nnnn xx mi
                                       #nnnn xx mi
```

Notice the 12x12 character formatting of the response message to fit on the 12x12x12x12 display lines of the D7. AND the use of 4 digit node names (we better start planning for it now!)

Notice, that since this is a message to individual W3XYZ, that individual may also receive the Query as a message as well. Thus he konws that someone is looking for him as a freebee.

2) NODE Dump: Unrelated to the individual query above, When we get to the point of dumping multiple NODE status to the front panel of the Kenwood radios I suggest a format that distinguishes between active and non-active nodes on the Kenwood summmary list. It looks like this:

```
  +---------------------------------+
  |  1: AnaplsMD.   20:36  OBJECT   |
  |  2: BaltoMD .   20:36  OBJECT   |
  |  3: WashDC  .   20:36  OBJECT   |
  |  4: BullRnVA=   20:36  OBJECT   |
  |  5: SanFrnCA=   20:36  OBJECT   |
  +--------------------------------+
```

This display shows 5 out of the 40 list at a time and makes it easy to see the status of multiple nodes in a dump from the local IRLP node (on its own frequency). The 9th character of the object name indicates its status. "." means idle, "=" means connected, ? means unknown, etc..

I SURE HOPE THE KENWOOD accepts punctuation in Object names?

An advantage of the OBJECT format also is that it DOES allow a full 9 character NAME without the 6x2 LETTERxSSID requirement. And also then the OBJECT format can convey any other APRS format and all the varieties of information possilble for each nodes PAGE display.

Next problem is how to restrict the data dump of hundreds (will be thousands before long) for the 40 you are interested in.

Do you request alphabetically starting with X
Do you request a LAT/LONG?
Do you request the nearest to X
Do you request only those in use?
etc..

I will add these thoughts to the AVRS ideas page tomorrow when I get a chance: http://www.ew.usna.edu/~bruninga/avrs.html

Rendered body type: text/plain

Hello all,

A bit of a technical question ...

I have data coming to me over a TCP/IP connection from a WINaprs client.
I've
noticed that WINaprs terminates its frames with a '\r', whereas other
clients
like UI-View and APRS+SA terminate theirs using '\r', followed by '\n'.

Does WINaprs have an option to include the '\n' NEWLINE character ?

If the price is right I could use two. I already have two Motorola FRS and a Etrex. If there is a NMEA output It could also be used for APRS on the ham bands for a tracker.

>From Garmin's web site:
Rino 110 and Rino 120. These GPS devices integrate radio functionality to
provide two-way communications up to two miles using FRS channels and up to
five miles using GMRS channels.
*********************************************

Hmmm.... the radio it would seem, knows to use high power on GMRS
frequencies.  I wonder if the "no auto tx on FRS" rule is in effect on GRMS
too?

Also, once we figure out the protocol, can we assume that aprs clients will
read it?  Great for search and rescue.

Tounge in cheek comment du jour: This is a great idea... somebody like
kenwood ought to make a HT like this!! <grin>

Wes

Chrg:  $0.00   Imp: Norm   Sens: Std    Receipt: No    Parts: 1

Trying to decide between these two color GPS units that both seem to
interface with the Kenwood D700. Any info would be appreciated.

Gun Steele WØGUN <<

Gun,

I have the D700 and Streetpilor Colormap.  They work find together *except*
that the Streetpilot Colormap does not have the capability of obtaining
waypoints (APRS stations) from the D700 and displaying them on the map.  It
is my understanding that the 176C *does* have this capability.  For at
least that reason, I would go with the 176C.

73,

197. [aprssig] PCsat GPS on.

From: Bob Bruninga <bruninga@usna.edu>
Date: Wed, 9 Jan 2002 10:13:41 -0500 (EST)
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-56157-2002.01.09-09.43.16--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

We turned on the PCsat GPS today for two passes, but on the second one, I screwed up the OFF command so it is staying on until the batteries discharge down to failsafe and or 9 Jan 1135z when I get a last chance to turn it off.

No big deal, but if you are capturing anything on the 144.83 downlink at 1200 baud, you may see $GPGGA sentences and if you are capturing anything on 144.39 at 9600 baud, you will get the MITEL data formats.

Either one we would love to have...

Of course if it is still running by 1135z I may just leave it on because that means we have enough sun power to keep it on...

Hello Keith

Could this problem be related to my (and others) earlier reports that
MacAPRS 3.5.2. seems to behave as a one-way street under Open-Transport
as far as the TCP/IP ports and IGATE function are concerned?

Good to see that you are still working on MacAPRS.

I wish you a Happy New Year

```
One important thing I rarely see listed here is that some GPSs only
have NMEA out (Street Pilot family) and others both send and receive
NMEA (Marine Units). If you want received position reports to create
waypoints on your GPS you will want to make sure you can do both.
```

Automatic waypoint creation comes in real handy when you are tracking
a moving object like another land or maritime mobile or a balloon.
The waypoint of the moving object will update every time you receive
a beacon. Cool.

Most GPS unites marketed to the automotive/sportsman market do not
include this ability. GPSs marketed to the Marine and Aviation users
need to be able to communicate with a host of other devices
(autopilots, plotters, radar. etc.) and thus implement the full NMEA
standard.

I can't point you a color GPS that will do this, but if you dig down
into the specs of the units you are interested in you will find out.

To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-56173-2002.01.09-10.53.27--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

List:
I know this was brought up a long time ago but I don't remember if there
was any resolution. In winaprs was there ever a fix to keep the county
warning areas from staying as the top layer on the radar map/ intelicast
images. During the last snow storm it was impossible to see the radar within
aprs because the county warnings colored in that area of the map over top of
the radar data.

Thank you,
Brian N2KGC

Please be careful on the version of StreetPilot you get.
I had a unfortunate experiance that the StreetPilot Colormap would
not accept data from the D7. Garmin manual stated it would,
but the factory support stated it was not designed to. They
indicated that the StreetPilot III is the only one capable
of interface with other NEMA devices.

Subject: [aprssig] GARMIN COLORMAP STREETPILOT OR 176C?

Trying to decide between these two color GPS units that both seem to
interface with the Kenwood D700. Any info would be appreciated.

Yes, The Sprouls came up with a positionless WX format, but APRSdos uses
the  original "complete" format that includes both the position and WX
data in  a single packet (that can still be shorter than their
positionless WX).

But unfortunately the "complete" format cannot report the station's COURSE
and SPEED.

But the END of the WX format is not explicitly defined.  So any info stuck
on  the end could be formatted to add the boats CSE/SPD.  But it wouild
take a  lot of testing to see if such a format was still readable by all
of the  various APRS programs out there.  APRSdos would have no problems
with it.

Lemme think about it and see if we can come up with a way to add it...
without breaking anything...

PCsat GPS remained on for a full orbit and volts remained above 15.6 or
1.3 volts per cell.  THus we 'may' be able to  LEAVE IT ON WORLDWIDE for
a while?  I left it on to see what happens next...

So watch for TELEMETRY of 00011111 where the 3rd 0 means the GPS is on
and:
```

$GPGGA sentences every 30 sec from W3ADO-1 on 145.83 1200 bd
MITEL data packets evy 30 sec from PCSAT-11 on 144.39 9600 bd

Rendered body type: text/plain

I just went in to RS to pick up one of those switches you plug into the
sound
card that gives you 'one button' changing from PC speakers or to a
telephone headset, and right next to them on the wall were cable sets
for various Palms. These are sold as 'HotSync' cables, but who cares.
They all had female DB-9s for plugging into a laptop, but you could either
make up your own GPS to male DB-9 cable, or a double male to connect
the two.

In any case, it's now a simple way to get GPS data to various Palms or
handhelds.

[aprssig] Re: GARMIN COLORMAP STREETPILOT OR 176C?Clark,
    I could never get my Magellan Map410 to accept any data and that was one of the reasons (plus the
vertical handheld form factor didn't lend itself to locating in the driver's view) I started looking for
 another device. Thanks for the heads up as I am also finding that the marine units seem to be more
likely to offer this feature.

  One important thing I rarely see listed here is that some GPSs only have NMEA out (Street Pilot
family) and others both send and receive NMEA (Marine Units). If you want received position reports to
create waypoints on your GPS you will want to make sure you can do both. Automatic waypoint creation
comes in real handy when you are tracking a moving object like another land or maritime mobile or a
balloon. The waypoint of the moving object will update every time you receive a beacon. Cool.

  Most GPS unites marketed to the automotive/sportsman market do not include this ability. GPSs marketed
 to the Marine and Aviation users need to be able to communicate with a host of other devices
(autopilots, plotters, radar. etc.) and thus implement the full NMEA standard.

  I can't point you a color GPS that will do this, but if you dig down into the specs of the units you
are interested in you will find out.

Why isn't it $GPGGA/1200bd on 144.39 and MITEL/9600bd on 145.83?

Well, yes, there could be a lot of 'gotchas' on this. But since the big
complaint here in previous weeks was NOT the interfacing, but finding
a cable/connector that just plain 'attached' to the Palm, I figured the
post would be of interest.

Rome Labs apparently inadvertently "experimented" with this "technology" a few years back. (They seemed to be pretty embarassed about the whole thing.)

220. [aprssig] HELP!

From: k9soa@att.net
Date: Wed, 09 Jan 2002 22:30:39 +0000
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-56233-2002.01.09-17.00.12--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Just trying to get started with APRS and don't think I have something set up just right.

Garmin eMap set to NEMA 4800, connected to TinyTrakII, to a Yaesu FT-2600M.

Sounds like data is going out every 2 minutes like I have it set to for testing but checking on findu.com, I don't show up. I hear it on a receiver in the house with the system running in the drive. How can I check to see if it is sending out the right stuff?

Have tried to contact the two local APRS calls I do see locally but no response so far.

The GPS does work fine on a portable and DeLorme Street Atlas Deluxe. Drove all the way from Louisville KY to just south of Gary and the map was right on the button.

Was hoping to get it going before I make the same trip this saturday but doesn't look like I will make it without some help.

Thanks for any help.

```
TOday we turned on GPS, but have not seen a single $GPGGA sentence from
PCsat via the Internet feed.  But we have seen them on RF. Seems that
there were no  SATGATES monitoring 145.830 in the USA today except maybe
florida?  We  only got a small number of packets near LOS and only the SE
USA was in the footprint then.

We do see some 145.83 data ofver europe, bust strangely, no $GPGGA's...

If you operate a satgate in the USA listening to 145.830 downlink, could
you check your system and make sure it is still up?  During a pass, I am
capturing 9600 baud data on 144.39 and I cannot simultaneousely be
monitoring 145.83 to see if the $GPGGA are coming down..

Did I mis-read this? Are you stating PC-SAT is sending 9600bps FSK data
on 144.39 which is a 1200 baud AFSK frequency?

(If yes, <techical scolding deleted> as they cart me off to the packet radio
funny farm)

I have an original TinyTrak that _does_ work with GPGGA.  I have it
coupled to a Trimble SV6 GPS board (through an inverting transistor),
which only puts out GPGGA and GPVTG sentences.  It might have been a
later edition of the TT-1 though.  I remember requesting support for
GPGGA sentences from Byon.

This query seems to be repeated (and answered) about once a week here or on
the TT list.

Just because you transmit doesn't guarantee you will automatically get into
findu.
1)  Your signal must be transmitted with a proper APRS format.
2)  It must be picked up by a station with an Internet connection ( "Igate"
-- Internet Gateway")  You must then hope the Igate is properly configured,
is not mangling your data packets,  and is actually transferring your packets
to one of the APRS servers that in turn communicate with findu.com.  Some
Igate software will now aggressively filter incoming data and NOT PASS it
along to the Internet if the formatting is incorrect.
3)  If there is not an Igate station within direct range of you, you will
need to depend on APRS digipeaters to relay your packets several hops via RF
before reaching an Internet-connected station.
4)  You must have the proper digipeater path set into your transmisssions
(optimum path varies arounds the US) to insure that you actually do get
digipeated enough times to reach an Igate

To verify you are actually transmitting a readable packet, monitor
off-the-air with an ordinary TNC and and any terminal program running on a
PC.  You don't need a specialized APRS program to merely monitor the
transmitted one-line packet messages sent by APRS devices.    If you don't
have a "real" (hardware) TNC handy, feed the receiver audio into your PC
soundcard line-input,  and use the AGW Packet Engine freeware soundcard
software TNC and a web browser to monitor.

Well, since I did not receive a reply with the first posting of my question,
here it is again.

Why does some of my position reports listed at findu.com show what looks
like a timestamp (@xxxxxxz) & some do not?

http://www.findu.com/cgi-bin/rawposit.cgi?call=n5eqt-7&start=500&length=500

Now that I re-read this, I'm not sure whether the TT-1 will put out
altitude. I don't think it does. I wasn't interested in altitude at
the time. I needed the TT-1 to transmit lat/lon using only GPGGA
sentences for input, and mine can do that. For GPS's that don't put
out GPRMC it's important to parse the lat/lon from GPGGA.

> handhelds.

Define "simple".  I'm not sure whether they have ones for the
Handspring line of PDA's, but here's a gotcha to watch out for:  The
Handspring serial cradle gets it's power from handshake lines coming
out of the PC.  If you try to hook it directly to a GPS via suitable
cables/adapters, it won't work.  You have to supply power to one of
two handshake lines in order to power up the chip inside the cradle.

Cables that provide RS-232 out of a Visor also need this power.  Some
of them get it from the PC side, some of them from the Visor itself
(which really sucks down your batteries quickly).

Find out how to power the thing before you term it a "simple" solution.

For my cradle, I made up a DE9 -to DE-9 adapter that has a resistor
inside and 9V battery leads coming out.  Using that I can hook my Visor
to my Picopacket or GPS.

markspace.com has various types of cables for hooking up Palm's and
Handsprings to serial devices.  I've been intending to buy one of
those but haven't gotten around to it yet.

Very much of interest!  Just didn't want a bunch of people wondering
why their new RS cable didn't work for the intended application.

Going in with more information they can get what they want, and it'll
work.

It's definitely nice finding a new source of cables.  I might have to
swing by one of the 4 RS stores on my way home and see if they have
```

something that would fit mine.

Rendered body type: text/plain

Ken,
AFAIK, Findu cannot decode the Mic-E positons and must relay on IGATES
to convert the raw data to a readable format.

The timestamp that is added by some IGATEs may be grossly incorrect. It
is the IGATES notion of the time and that can be hours off. Multiple
IGATES can convert the same message and the times will likely vary quite a
bit.

The differences in the timestamps can result in multiple packets being
generated that appear to be different, but were in fact converted from the
same Mic-E packet.

Many of the IGATES have been eliminating the timestamp for this reason.

Some IGATES also do not correctly convert the latitude and longitude. If
you are viewing a track of a Mic-E unit you may have noticed that at times
you will see small excursions from the actual route. Kinda like a sawtooth
track at times. This is not the fault of the tracker, but is the fault of
the IGATE that converted the data.

HTH.

232. [aprssig] IRLP Future

From: Bob Bruninga <bruninga@usna.edu>
Date: Wed, 9 Jan 2002 22:36:18 -0500 (EST)
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Cc: <irlp@irlp.net>, <irlp@yahoogroups.com>
Message-ID: <LYR842-56284-2002.01.09-22.17.06--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I know I am a newbee to IRLP/I-Link but have been promoting a parallel
voice equivalent for APRS since the 2000 DCC. IRLP/I-Link is the future
of HAM radio for end-to-end long-haul connectity! Please excuse my newbee
excitement and ignore me if all this has been said before.

But I assume that IRLP/I-Link will soon expand to 4 digits.
Having assumed that, we could also expand to some optional end-user=PL
digits which would set a unique PL at the far end for alerting
just the called party...

This is easy. Just hash the 36 numbers/letters of the alphabet to 36 of
the standard PL tones that match each end user's SUFFIX. Actually, since
those are just the 26 letters of the alphabet, then the 10 digits could
correspond to 10 SUBGROUPS...

There are two ways to hash the letters to a TTone pad. Here are the
exmaples for calling say my suffix (APR) if I am at the node #1436:

System 1: Dial 1436-7 This sends out PL equivalent to 7 = "P or R or S"

System 2: Dial 1436-77 this sends out PL equivalent to 7 twice = "R"
           Dial 1436-777 this sends out PL equivalent to "S" etc

System 3: Dial 1436-277 where "277" is the equivalent of "APR"

Again, this is unrelated to the other APRS/AVRS ideas which I have been
posting which are a parallel digital signaling system for those with
APRS mobile displays.

But this kind of end-user-PL digits can be used by anyone if the
IRLP/I-Link systems wanted to consider such a system...

And I assume it could be done transparently and backward compatibly to
what exists. In other words, if my local system implents end-user-PL,
then anyone anwhere on the planet that calls me needs only the local NODE#

```
to come out on our IRLP/I-Link system, but if he adds my unique
end-user-PL codes, then he will open MY squelch.

I the end user can decide to listen to all QSO's on my local node, or set
CTCSS and ignore everything except someone calling only me...

Forgive this newbee if this is an old idea...
But It sure is exciting to me!

N5EQT is using a tracking device that transmits Mic-E. Mic-E use to have a problem with certain Internet client programs in that not all the characters in the Mic-E packet were faithfully transmitted through the APRS Internet System (APRS/IS). To "solve" this problem, Mic-E packets were converted to a more APRS like packet. This has created an innumerable number of problems. As Bill has pointed out, timestamps are what the listening IGate thinks the time is. But eliminating the Timestamp will not solve the problem of eliminating duplicate packets that look different as there can be differences in character case, position and even the amount of data converted. In your example you posted, Altitude was decoded and included in the packet by one IGate, but not the other. One of the problems with Mic-E conversion was that some programs in the APRS/IS would convert Mic-E packets, even if they did not hear the Mic-E packet on RF, but only received them from a client program via TCP/IP. Well, these servers could be across the country, indeed, across the globe. The only real solution is to NOT convert Mic-E packets. Findu does not understand Mic-E. That can be handled by 1) fix findu, or 2) convert Mic-E packet going into Findu, and in to Findu only. That way right or wrong, it would be only one program to deal with.

Are there any program left that are trashing Mic-E packets as feed into the APRS/IS? Is Findu the only spot we need to worry about? Lets stop converting Mic-E packets now.

BH

> just the called party...
>

Neat idea Bob, but it might be tough to implement. It would require a system
that would allow a dynamic CTCSS code, controlled by the IRLP computer. I
don't know how many people have that built into their repeaters. This
wouldn't be able to be implemented on either of the two systems I have
running here in Edmonton. Both systems use link radios to talk to the main
repeater. One system requires 103.5 to open the squelch on the repeater, and
the same tone is used on the backhaul to track user COS. We do not have the
option of using multiple CTCSS tones there. The second system is tied into
over 30 link sites across the province, and using CTCSS tone signalling
won't work there either.

Some nodes may be able to dynamically change CTCSS tones, and may want to
implement something like this. However, this is going to take more user
intervention than probably wanted. This type of system is used on shared
repeaters all the time, but the commercial radios usually have a hookswitch
feature. When the mic is taken off the hookswitch, the CTCSS decoding is
disabled. I haven't seen an amateur rig with this feature yet. (I'm not an
expert either). If I set my rig to alert on my particular CTCSS, I will need
to turn off the CTCSS before I can make a call on the repeater, so that I
can be sure that no one else is using the repeater with a different CTCSS.
Not a nice easy transparent system.

Now, DTSS signalling may work, but even that isn't fool proof. Some people
don't like hearing DTMF, and use DTMF muting on the repeaters... that's not
going to cut it either!

> And I assume it could be done transparently and backward compatibly to
> what exists

Currently, the whole dtmf string from keyup to keydown is matched to the
node number list to determine if it is a valid string. Appending sub-strings
would require a change in the script used to decode the dtmf strings.

It could be done, but will anyone implement it?

Keep throwing the ideas out... I love the way your mind works, but I think
you need a real job, you spend too much time thinking of all this stuff!

238. [aprssig] Format of reverse-gated traffic on RF

```
From: "Mark Conner" <mconner1@home.com>
Date: Wed, 9 Jan 2002 22:39:31 -0600
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-56301-2002.01.09-23.09.19--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain
```

```
I noticed an oddity while monitoring the RF traffic this evening.  I've
modified all callsigns below except my own to hopefully prevent the idea I'm
badmouthing anyone, but the modification is consistent.  I sent a message to
N0XXX-1 which was not digipeated (that I could see) but also went out TCP/IP
```

and was reverse gated by what I think is NX0X-15. However, the callsign appearing at the front of the string in Packet #1 is mine. Is this correct, or is this some misconfigured or old software performing the reverse-gate function?

I don't really care that it was reverse-gated, but a quick look at the RF output would make many people think that I originated this particular packet on RF, when in reality it was reverse-gated by another station. Packet #2 was indeed originated by me on RF, and packet #3 is one I (N9XTN) reverse-gated using APRSPlus. My thinking is that the station who reverse-gated Packet #1 should have his callsign "up front", not mine. Mine should only appear after the first '}' in the string (i.e., packet 3 is correctly formatted indicating N9XTN transmitted it on RF locally, but KA0XXX originated it and N9XTN got it from the TCPIP stream).

```
Packet #1
N9XTN>APD214,AXXX,K0XXX-1*/1:}N9XTN>APS203,TCPIP*,NX0X-15*::N0XXX-1  :Hi

Brent,
  You covered just about all of the bases. However, there was one Mic-E issue not mentioned that is causing other problems.

It seems that some legacy software and TNC's are not permitting 8 bit characters to be passed as received. Extended characters may be deleted, replaced with a space, or the high order bit may be removed. This can cause some of the Mic-E data to be lost or to change the meaning of the remaing Mic-E data.

Bill KC9XG

All Mic-E data is 7 bit. There are no high ASCII characters used by Mic-E,
correct?   The problem is/was the control characters in low ASCII which
some programs did not handle correctly.   Not high ASCII.   If there are
programs that are trashing Mic-E, let's identify them.

Rendered body type: text/plain

Packet 1 is very strange indeed.   The RF callsign is most likely NX0X-15.
APRSd v2.14?
Packet 2 is a normal RF packet
Packet 3 must have been generated by APRS+SA with the Gate-By-Callsign
function enabled as this is a status packet and would not have been gated to
RF by the usual APRS/IS messaging system. But it indeed formatted
correctly.

>
> Query APRS message:    TO: W3XYZ  MSG: ?AVRS
> AVRS Engine response:  TO: mycall MSG: #nnnn xx mi
>                                        #nnnn xx mi

So, this AVRS info engine would need to scan the subject of every message to
everyone looking for the text ?AVRS, and once fining that, respond back to
the sender, right? Normally, a query would be sent to the AVRS info engine
in this type of format.

TO: AVRS MSG:W3XYZ
```

Which would return the same response. The second step would be to call the other station via IRLP, and or send an APRS message as shown in your example.

I don't understand what the second node number and distance display is though...

> Notice, that since this is a message to individual W3XYZ, that individual
> may also receive the Query as a message as well. Thus he konws that
> someone is looking for him as a freebee.

Makes 2 steps into one... it is possible.

> 2) NODE Dump: Unrelated to the individual query above, When we get to the
...
> Next problem is how to restrict the data dump of hundreds (will be
> thousands before long) for the 40 you are interested in.

Do you really want to dump all of them? I had suggested sending a query to a server which would then respond with the status of the node queried, and if busy, it would watch the node status for 'x' minutes, and send you a message when the node became free within 'x' minutes.

> Do you request alphabetically starting with X
> Do you request a LAT/LONG?
> Do you request the nearest to X
> Do you request only those in use?

All this could be implemented, but the way I use IRLP, I know where I want to call into, and I know the callsign or node number already. All I'd really want to know, is when the node status became idle if it was busy when I tried calling in. There are always other opinions...

I would probably make use of the "Closest node to W3XYZ" server to find friends who are on the road. Query the server to see if the guy is within range of an IRLP node, send a quick APRS message to wake him up and QSY to the frequency if need be, and then call up the node!

243. [aprssig] Re: APRS monitoring with AGW Packet Engine

From: WA8LMF2@aol.com
Date: Thu, 10 Jan 2002 00:38:19 EST
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Cc: k9soa@att.net
Message-ID: <LYR842-56323-2002.01.10-00.09.22--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

In a message dated 1/9/02 7:34:10 PM Pacific Standard Time, k9soa@att.net writes:

> That is the type of info I am trying to find out about.
> I don't have a TNC on the home system but I have DL AWG
> and am trying to get it going now.

Monitoring via soundcard, AGWpe and a web browser is a very useful tool for debugging APRS gadgets and software, since it lets you easily view as-received raw packets before they are interpreted or altered by application programs. [I use this setup on my laptops along with a Bearcat scanner for APRS monitoring/debugging.]

Visit the site :
   http://www.qsl.net/soundcardpacket

for more information on setting up AGW.

Note: This website does not discuss how to use a web browser with AGW; only major packet and APRS programs.   Using the browser is very easy (at least if you have the current Microsoft TCP/IP stack aka "Winsock2" which is standard equipment with Win98 and later, and a free downloadable update for Win95).

SETUP
Install AGW (actually there is no real install -- just unpack the files in the downloaded ZIP file into a directory on your harddisk, and create a desktop shortcut to "AGW Packet Engine.exe").

USEFUL HINT: The program assumes that you will also want to transmit with AGWpe and insists that a port be assigned that will be used for PTT keying of a transmitter, even if you only want to receive. To avoid tying up and "wasting" a serial port, download the parallel port driver VXD from the AGW web site. Assign a non-existent parallel port to the PTT configuration dialog (I use "LPT3'). The program is perfectly happy to bit-fiddle a non-existent parallel port, and will leave your serial ports alone.

Start the program and click on the twin towers icon in the Windows System Tray. Choose "Setup Interfaces" Select the first tab "Winsock Interface" and check the box "Enable Winsock Interface". Select the third tab "HTTP Interface" and check the box "Enable HTTP Interface". Note the port number. If you don't have any other software running in your computer trying to act like a web server, leave it as-is. If other web server apps ARE running, enter a different port number -- port 80 is normally the default TCP port for web browsers. Close the "Setup Interfaces" dialog. This setup only needs to be done the first time -- these settings are stored in the agwpe.ini file for future use.

OPERATION
Start AGW and click on the twin towers tray icon again. This time, choose the item "Start IBROWSER". Your default Web browser should start with a green-textured-background "web page" created by AGW with a login/password prompt. Ignore the password prompt (it's just for other users that might access your PC over a LAN or the Internet) and just click on "Submit" You should be taken to a white "Main Menu" with several clickable links. Click on the "Monitor" page. Anything that is heard off the air should now start appearing in the browser. Note that the web interface also maintains an MHEARD list that will display all the calls heard.

If nothing happens, try starting the browser by hand and enter "http://127.0.0.1:80" into the address bar. [The IP address 127.0.0.1 aka "localhost" has special "magic" properties -- it always refers to the machine the browser is running on; i.e. your own machine.] Note that firewalls such as AtGuard, ZoneAlarm or Norton Internet Security can interfere. Either disable them for the duration, or edit their pass/block lists to allow localhost:80 to pass freely.

> to see if it is sending out the right stuff?

First of all, not making it to findu.com doesn't mean you're not making it. It just means you're not making it to an igate, or at least not to an igate that's connected into the main feed that findu.com is.

You might try looking for an e-mail address of the local hams, either from their broadcasts on the air, or from qrz.com. Ask them via e-mail if they hear you, and ask for a phone number so you can talk further.

What's your path set to? Depending on your area, you might want to set it to RELAY,WIDE3-3 or RELAY,WIDE,WIDE,WIDE. In the northwest we use the former. If you have Kantronics KPC-3+ TNC's on the hilltops they'll understand that protocol. If not, you'll need to use the WIDE,WIDE,WIDE type of path.

Don't go too long on the path either. They can generated _lots_ of packets.

How do you know you have the deviation set right? Best way is a deviation meter, but you can also set the deviation to where your system "sounds" just slightly quieter than other stations on the air. Most people are running too hot.

It's also possible that your calibration is not correct for your crystal or ceramic resonator on the Tinytrak-II. In that case your modem tones as a group might be shifted too high or too low for other TNC's in the area to decode easily. If you kept it at the default you're probably close though.

Good luck,

On Wed, 9 Jan 2002, Joe Della Barba wrote:

> My TT II will NOT achieve connection with my computer, but does pick up the
> GPS signal.
> Any ideas? I checked all the obvious stuff.

The GPS connection requires only two pins to the PIC. The computer connection requires three. Check that third pin. Perhaps a poor solder connection to the board?

Some laptops and perhaps desktop machines don't put a lot of voltage on the RS-232 lines. With those machines the TinyTrak might not talk. Try another PC, preferably a desktop PC.

If you built the TT-2 per the instructions, it should plug directly into the computer with no adapters or cables. If you're trying to hook a cable in between the two, you might be reversing pins 2 and 3.

I built my Tinytrak's with the opposite style of DE-9 connector to what they came with, and swapped the pins around. They connect to a GPS more easily, but require adapters to connect to the computer. The normal connection for my Tinytrak's is to the GPS anyway. My standard GPS-to-PC cables now connect straight to the TinyTrak's.

Good luck,

I don't think that we jam it,  if we did we would not
be able to hear it ourselves.   Without gettin' too much
into it.  The accurate signal is encrypted for DOD users.
The signal sent in the clear is off by some amount.

Wow, neat idea!  Ill ask Kenwood to put this in their next radio (hi hi).
A simple magnet in the dashboard HOOK and a magenetic reed switch in the
microphone would sense the off-hook condition!

Im thinking these ideas because what we are talking about here is
"HAM cellular" and I am sure that is where we will end up...

Rendered body type: text/plain

Great feedback and comments about AVRS etc.

Remember, I am not trying to break anything that is working very well.
Just trying to think about a few years from now when we may have 5000
nodes and Everyone has a full time rig on his "AVRS" channel for incoming
"calls". As the system gets more popular, cells will have to get smaller
and more of them to support the traffic load...

Also, AVRS is not trying to usurp the name either, but just a way of
distinguishing what "could be" from the excellent systems we have now...

(Wishful thinking? NO if you think the hobby is growing and this is the
greatest thing since FM, YES if you think the hobby is dieing...)

OK, did not know it was that complicated.

I run a 30 < > 2 Meter gate and an APRSDAT station
and every morning when I calibrate one of my R-390As (always
seems to be off a few cycles, as I do NOT run the oven), I spin
up to 7335 kcs (no kHz on this oldie, but goodie) and check the
'puter clocks on the gate and APRSDAT (that one has to be right
to get the pass data right!) against CHU.

Did not know that the Igates were that much different.

Subject: RE: [aprssig] Re: Sometimes There's a Timestamp....

Ron,
  Many IGates are unattended for long periods of time.

It is possible for clocks to gain or lose time or to be improperly set.

There is currently no way to automatically sync all IGATE clocks on the
APRS IS.  Therefore, when multiple IGATES convert the same Mic-E packet,
the resulting timestamps can differ.  This and other conversion differences
can cause 5 or 6 different conversion results to appear on the feed from 1
raw Mic-E packet.

There is no way to determine if any given timestamp is correct except to
compare it with the time on the receiving system. If the receiving system
clock is not accurate then any comparison is useless.  The simplest
solution was for IGATE applications to have the option to turn timestamps
on or off.  When conversion timestamps are turned off, an inaccurate
timestamp is not propagated through out the entire APRS network and the
number of duplicate conversions is reduced.  Options are also available in
some IGATE applications to turn Mic-E conversions off entirely.  Each APRS
application should have the ability to convert the Raw Mic-E packets to a
format for mapping and text displays.  Therefore, conversions by 3rd
parties should not be needed in APRS compliant applications..

When a timestamp is not present in a converted packet, the receiving
station uses the time of reciept as an internal time stamp. The receiving
stations notion of time may be more important to the user than time
provided by another system with unknown time accuracy..

If a method was devised to sync all IGATE clocks, there is no guarantee
that all IGATES would be uprgraded.  APRS has many legacy IGATE
applications that are several years old.  These may continue to operate
without being upgraded.

Having extreme difficulty changing the Kam XL ports with the current
APRS programs, ie., DosAPRS and APRS+SA. In order to change ports I have
to temporily suspend the program(s) in question and intiate an external
terminal program, such as PACTERM, and issue the TNC commands by that
means. The APRS program's internal TNC Command mode will not work.

Also observed..the dual porting capability is not functional..either the
program or the TNC fails to recognize that command.

My intention all along was that the GATE symbol would be used with the
OVERLAY character of "I".

Unfortunately, I  think WinAPRS defaulted to the TCPIP Icon I think.  That
ICON was intended for TCPIP RF networks on AX.25.

That definitely was not one of Kantronics "better ideas".

They have discontinued the KAM XL and are goin' back to
a dual port ala KAMPlus (cna't remember name, but it is on the
Kantronics website.

KAMPlus are runnin' less than $200 on the used market now.
That is my TNC of choice for gates.  I use one on
my APRS 30 <> 2 meter gate and an
```

ARES 80 <> 2 meter gate.

For those running IGates on Linux (or other *nix) machines, the ntp (network time protocol) makes it very easy to keep your system clock to within a few milliseconds of "the right time." There are bunches of public ntp servers available that you can sync to, and the ntpd daemon runs continuously in the background so clock sync can be maintained pretty much forever. Of course, this assumes a network connection, which in theory an Igate should have :-) Alternatively, ntpd can also sync directly to a GPS with a 1pps output (actually, any NMEA-output GPS will work, but with much poorer resolution).

There are also network time sync programs available for Windows and I'm sure other desktop OSs, but many (most? all?) of them are "one shot" programs that will set the clock when run, but won't manage it on an automatic basis. That's where ntp really shines.

Hi, Mark.

Did anyone ever respond to your marathon question?

If not, I'd be happy to help. We can do that privately or on the SIG. You can also search the APRS SIG archives for past discussions on "marathon" and "race"   http://www.tapr.org/tapr/html/sigf.html

There are several different approaches and techniques in using APRS during races. At some point, I think you'll want to bring your questions back to the SIG to get other perspectives. Asking a very specific question will usually bring out the true experts.

73,

Ralph, KC2RLM

1. I would like someone to tell me which APRS program is preferred (UI-VIEW or WINAPRS are ones that come to mind). I am creating maps, and would like to move points on the map (relay exchange points, water stops, AID locations etc..) without much difficulty during the race. Being able to beacon their location is not required. The points I would like to beacon requiring mobile APRS would be the SAG vehicles, lead vehicle and the like that would require about ten APRS units and Transmitters. The rest of the points may be "static" points that do not require beaconing, but just dynamic "ID's" on the map that may be changed either by changing a table of points, or moving the simbology.

I believe that submitting comments of this nature would be imprudent, at best.

William C. Houlne submitted comments that said essentially this (along with a bunch of other stuff I didn't understand on my first reading of his document). To find Mr. Houlne's comments, go to the FCC's Electronic Comment Filing System page at:

http://www.fcc.gov/e-file/ecfs.html

and search for Proceeding "01-339" under "Search for Filed Comments".

The FCC rejected this line of reasoning in their NPRM, available at the URL listed in Cap's e-mail:

http://hraunfoss.fcc.gov/edocs_public/attachmatch/FCC-01-366A1.doc

Specifically, the FCC said, to quote from the NPRM:

10. ... Further, we disagree with Mr. Houlne and tentatively conclude that it is unnecessary to amend the rules to specify methods and standards, such as the AX.25 standard and the Automatic Position Reporting System used by amateur radio operators, with respect to the data transmission itself.   We believe that specifying exact methods and standards would limit the flexibility of manufactures to incorporate new technologies as they are developed. We invite comment on whether there are any other changes to our Rules that would allow manufacturers to develop additional means of incorporating GPS information into FRS radios. ...

Given that the FCC has rejected the argument once, I doubt that a pile of comments from amateurs repeating the same argument would be particularly useful.

Note that the FCC's basis for rejecting Mr Houlne's suggestion, namely that the FCC doesn't want to limit the flexibility of manufactures to develop new technologies, appears to be deeply held by the current Commission, and so very compelling evidence would be required in order to violate this guideline in this instance.

263. [aprssig] USB-to-DB9 Adapters and AGWPE

From: Ralph Milnes <milnes1@rcn.com>
Date: Thu, 10 Jan 2002 12:03:39 -0500
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-56401-2002.01.10-11.33.16--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I'm trying to find a USB-to-DB9 adapter that will work with AGWPE (and APRS).

I bought one from Belkin (F5U109) that works fine with TNCs (and I assume GPSs), but it won't work for PTT switching. AGWPE and other sound card programs control the radio PTT line via the DTR (#4) and/or RTS (#7) lines. The Belkin product puts a steady voltage on those lines (perhaps as a way to feed power to PDAs?).

Any knowledgeable USB/Serial folks out there? Should I be able to find an adapter that doesn't do this?

73,

Ralph, KC2RLM

It might be prudent to take this off-line pretty soon, but I'll give it another shot here on the list. It might help someone else attempting to troubleshoot their unit.

Did you check the solder connections and components from the two pins on the microprocessor, through any resistors, to the DE-9 connector? Make sure that you didn't miss something there. Do a continuity and resistance check with a meter just to make sure.

If it's a Tinytrak-II, you need to use the Tinytrak-II configure program. If it's a Tinytrak-I, then of course use the TinyTrak-I program.

Do you have a Palm or Handspring PDA? Have you installed the software for them? If so, they like to hang on to the serial port unless you disable them. Can you use the serial port for other things via a terminal program? Anything else that might have latched on to your serial port and might not let go?

What OS are you running? I've run the config programs on Win95 and WinNT. It's possible they might not work properly on Win98, WinME, or Win2000. I don't know 'cuz I haven't tried them.

The TinyTrak, if built per the instructions, will plug directly onto the PC. That's your surest method of making sure the wiring is correct between the PC and the TinyTrak.

You might also power cycle the Tinytrak after hooking it to the PC. See if it starts to respond to you via the "Version" button.

I played with one recently that keeps getting zapped by RF because it is mounted _very_ close to a 5W transmitter. We're working on getting it isolated via a metal box and ferrites and such. Anyway with this one after it gets zapped it doesn't like to talk. Clicking on the "version" or the "read config" buttons doesn't work, but clicking on the "write config" button does work. After that it starts talking nicely again to the computer. Perhaps yours got into that condition.

I've found that a cap across the base and emitter of the PTT transistor works wonders as well. In strong RF fields the TinyTrak can lock up into continuous transmit without this cap. I'm also starting to put caps around the 78L05 and across the uP in an attempt to make this particular unit more bulletproof. It's a friend's unit. My main unit, inside an ammo-can with a 50W transmitter, does just fine.

I just looked you up. You're at the other end of the country from me, else I would have offered to try configuring it for you.

Hang in there.

Rendered body type: text/plain

I finally reached someone at Garmin by phone with the following details:

Colormap StreetPilot (non-talking) NMEA output only (no waypoints from D700)

StreetPilot III Voice Automated NMEA output & input (with current upgrade)
Additional coverage out in the hinterlands for the direction/speaking
function
due in the next couple of months. Most metro implementation for now.

176C (large color marine) NMEA output & input, but straight line info only
None of the direction bells & whistles.

I guess it comes down to pricepoint (SP III $700+ & 176C $475+) or features.
The low profile appeals to me as well as the split screen (map & speed), so
I will go with the SP III and figure on moving it from vehicle to vehicle.

Seems to me the APRSAir program uses a concept of receiving
information from airliners and sending OBJECT packets instead of
re-transmitting the actual data. Might be a thought for this, too...

> require about ten APRS units and Transmitters.

Excellent. But for small marathons, the LEAD is the least important,
because APRSdos long ago recognized that the LEAD is 100% predictible
within a few hundred yards throughtout the race, so a special version of
APRSdos was written that will dead-reckon the movement of the LEAD runner
(as well as any other Runner placed on the route...).

Thus everyone monritoring our events not only sees the important vehicles,
but also, interesting runners such as:

1) Lead Handicapped (Usually out in front due to wheels) (10 Kts)
2) Lead Male (9 Kts)
3) Lead Female (8kts)
4) Pack (7 kts)
5) Juggler (one guy juggled the whole way) 5 kts
6) TAIL (This one must have APRS and GPS as it is unpredictible)

Only one person has to run APRSdr (Dead Reckon) and any object placed on
the "course" will be automatically deadreckoned as an object and
transmitted once a minute to everyone else. To everyone else, running any
kind of APRS software under the sun, these runners look just as if they
had GPS on them....

The operator of the APRSdr simply monitors the voice nets and when ever he
hears of an "observation", he just checks his display and if it is current
(It ususallly is right on) he does nothing. But if the dead reckoned
object is ahead or behind, he just clicks it, moves it, and hits enter and
now it will DR from there onward.

This really simplifies a lot of logistics.
Also, this same person can be moving all other logistics ICOns as they
move about based on what he heares on the voice nets. Thus, HIS display
is always perfect, and HIS display updates everyone else in real time.

This is what APRS was designed to do.
If you have GPS, then that is just icing on the cake.
But dont overlook the cake!

APRSdr has to be installed over an exsiting APRSdos directory:

   ftp://tapr.org/aprssig/dosstuff/APRSdos/aprsdr.zip

Read APRSdr.txt on how to use it...

P.S. ANY APRS program can be used this way as long as the runners are
given a COURSE and SPEED. But then you have to be attentive around
corners and change these around corners. The only thing APRSdr does is
watch the RACECOURSE itself and automatically change the HEADING at all
corners for you so there is no human intervention unless the DR soultion
gets more thansay a hundred yards off.

Remember in the early days of GPS with 100 yards of SA ambiguity, the DR
approach was usually MORE acurate! On our small 10K runs, etc, we only
use APRSdr and dont bother much with any tracketrs.

It lets those people with Kenwood HT's standing at a street corner see
when the runner is .1 mile away and that is when he alerts the cop to
prepare to stop
traffic... No voice comms needed.

The standard land-mobile approach (ever since Motorola introduced "PL" --
Private Line (r) in the late 50's/early 60's)   has been an additional
conductor in the mic cord connected to the hanger button in the back of the
mic case. The hanger clip mounted on the dash (or where-ever) is grounded
(derives from the days when vehicles actually had metal dashboards that were
part of the vehicle chassis). Base station desk mics always have two buttons
in their base - one is the standard normally-open PTT; the other ("Monitor")
is a normally-closed push button that defeats the PL when pressed.

> Any knowledgeable USB/Serial folks out there? Should I be able to find an
> adapter that doesn't do this?

Probably not. The serial port created by these devices is purely a logical one. The hardware PTT control implemented on traditional "real" serial ports by ham applications is almost always done by direct writing to the uart control register addresses (or as close to that as the operating system will allow) to allow the unorthodox use of these lines independent of the data transmission.

The assumption of the USB-to-serial adapters is that you want to transmit data streams through the TXD/RXD lines and leave the register-level control up to the operating system. They would not expect APPLICATIONs to do bit-fiddling with RTS/CTS/DSR etc; only be the originator/receipient of data streams.

You will find this whole issue of unorthodox use of port handshake lines by ham applications will get even worse with XP since it's NT-heritage behavior is to do everything it can to prevent end-runs by applications trying to bypass the OS and talk directly to hardware.

In the future, probably a tone-keyed (vox-operated) interface will be the only easy way to key radios. (Unless you want to develop a specialized USB-to-multiple-single-bit interface and provide it with a system-level driver that ham apps could then call.) (Or provide sound card interfaces with TCP/IP connections that would plug into your Ethernet card or hub.)

Hi Tom,

We use the Gate Icon with an "I" overlay to indicate an IGate
with our APRSPlus IGate system in Huntsville, AL. We had
been using the TCPIP icon in the past, but made the change
in recent months since it seemed to make sense. This scenario
makes the station more identifiable when seeing the letter
I beside the Gate icon on the Kenwood handheld or overlayed
on the other APRS software maps.

73's,

Tim - N8DEU
Huntsville, Alabama

Thanks Tim, I forgot that one. I remember seeing the Gate Icons with
the overlay I on the front panel of my radio while traveling over XMAS and
it really looks nice! Now that I think of it, I was driving through North
Alabama and it was your IGate!

Now if for no other reaason, that should convince them to use the right
Icon. This way HF gates also show up nicely on the front panel.

Hi Bob and all,

I thought the tcp/ip was primarily to indicate that I am
connected to the internet, but that I AM NOT an I-Gate.. When I
see tcp/ip, I think of them doing what I am doing, hi... I like
the Green Star with the "I" overlay also to indicate an I-Gate...

BUT what about stations like me, I got a Igate up now and have my HF
gate up now ?IG?2I ? I just call it the Tri-Mode Gate in my beacon.

Thanks Tim, I forgot that one.  I remember seeing the Gate Icons with
the overlay I on the front panel of my radio while traveling over
```

XMAS and
it really looks nice! Now that I think of it, I was driving through
North
Alabama and it was your IGate!

Now if for no other reaason, that should convince them to use the
right
Icon. This way HF gates also show up nicely on the front panel.

For your case, how about the letter "O" (or the number "zero" which looks about the same) overlaid for "Omni-gate"

Good point!

How many actual on-air-TCPIP networks are there?
And the only reason for the icon was so that they could beacon their posit
every now and then so that someone scanning freuqncies would see what
kind of "service" was on that channel and where.

Maybe in APRS we should do what you suggest:

1) ABANDON the definition that TCPIP ICON was for actual TCPIP on-air
2) Define it to be like you, Conected to the internet but NOT GATING
3) All IGates use the GATEWAY Icon with "I" overlay

Actually the actual on-air-TCPIP-packet networks can still use the ICON
and since they are not on an APRS FREQUEWNCY, then we will know
immediately the difference...

I can go along with that! Great thinking...
(or why did it take me so long to see that which was obvious)

I reset the TNC-A on PCsat and it is now sending down valid $GPGGA posits
on 145.83 from its own GPS as it flies along... BUT they are preceeded by
a LINEFEED.  Notice 6 or more satellites in lock...

ALSO it is sending down $GPGGA on 144.39 but that is stuck at 9600 baud
still...  This condition will remain until about 1200Z or so on Friday
which is my next pass...

I cannot find the command in the Kantronics manual to send to PCsat's TNC
to say IGNORE LINEFEEDS that it is getting from the GPS on the serial
port.  In a TAPR-2 clone TNC, that command wwould simply be LFIgnore...
But Not in Kantronics or I am having a brain glitch...

On the ground you should be able to  have your TNC do an LFI or equivalent
on the ground to ignore the LF and then your APRS should track PCsat!

Im late for my kids School Play so gotta run, but I left the GPS on even
though its batteries are low, because it is in SUN anyway... and should
dump the GPS if batteries get too low..  I woiuld ask you to go easy on
the messaging tonight so we can see how well the GPS works for a day...

I have a KPC-9612+ TNC for sale.

Has current firmware, and the 3rd port option installed.

Can operate 3 ports/radios simultaneously:

Port 1: 1200bps.
Port 2: 9600bps-38.4kbps (56k with a crystal change).
Port 3: 1200bps.

If interesed, or for more information, please contact me directly off
the list.

Cheers,
Tino - VE6SZR
Calgary, Alberta

288. [aprssig] APRIL OKC Marathon and APRS

From: "WL7FT" <wl7ft@mmcable.com>
Date: Fri, 11 Jan 2002 10:43:03 -0600
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Cc: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-56552-2002.01.10-23.13.20--lyris.aprssig#tapr.org@lists.tapr.org>

Rendered body type: text/plain

I have had an outpouring of support and discussion of many facets of what it takes, the many varying opinions of which program is best, and Some quite interesting viewpoints as to the necessity of using APRS during marathon operations.

Work has taken it's toll this week, as I have had very little time to extend towards replying to each and every one of those who were polite enough to answer my questions.

As far as the marathon is concerned, we are pressing on full steam to get APRS instituted into our marathon operations.

I still have had no takers as to my question about the VISOR handheld PDA and the pinouts on the serial cable. Basically will the Magellan or Delorme GPS module that plugs directly into the PDA work with APRS thru the 8 pin connection at the bottom?

Which cable should I get in order to ensure that I have the right cable/wires as some cables do not have all the wires connected to the port. The charger cord is the cheapest (19 bucks) but does it have all the wires to connect it to an TNC/Tiny Tracker?

I'll go out and buy the GPS unit, but I can't seem to get a straight answer from anyone as to which cable to use and if the pocket ARPS supports using the internal GPS unit?

Many thanks
73 de WL7FT/Mark

Subject: Re: APRIL OKC Marathon and APRS

Hi, Mark.

Did anyone ever respond to your marathon question?

If not, I'd be happy to help. We can do that privately or on the SIG. You can also search the APRS SIG archives for past discussions on "marathon" and "race"   http://www.tapr.org/tapr/html/sigf.html

There are several different approaches and techniques in using APRS during races. At some point, I think you'll want to bring your questions back to the SIG to get other perspectives. Asking a very specific question will usually bring out the true experts.

73,

Ralph, KC2RLM

1. I would like someone to tell me which APRS program is preferred (UI-VIEW or WINAPRS are ones that come to mind). I am creating maps, and would like to move points on the map (relay exchange points, water stops, AID locations etc..) without much difficulty during the race. Being able to beacon their location is not required. The points I would like to beacon requiring mobile APRS would be the SAG vehicles, lead vehicle and the like that would require about ten APRS units and Transmitters. The rest of the points may be "static" points that do not require beaconing, but just dynamic "ID's" on the map that may be changed either by changing a table of points, or moving the simbology.

The KAM XL just came out.  I think you mean they're discontinuing the
KAM98.  THAT was a bad idea!  I never could figure out why anyone would
buy that.  Less features and higher cost!  The KAM XL looks pretty cool
- although a little expensive.

Good morning all.

Just had a nice PCSAT pass up the east coast.

N8TLV - coord. put him about St. John's, Newfoundland at 1000 miles.
K4MLS-1 - 1113 miles
W2KQ - no position, not in LIST, but with MSG.

Also saw a G4??? & EI???? but neither show up in the LIST on my TH-7Ag. Too
bad. Those would have been nice for distance. Maybe in the future!

Arnie, N1BAC

Yes, if they would use APRS or GRID Square formats then all of the mobiles
```

and handhelds would capture them. As it is, the display only flashes
their callsign with a "??" and nothing else. So a lost opportunity for a
contact...

For stations not running APRS or Kenwoods APRS radios, the easiest format
to use will be the GRID formats. Here are examples for FM19SS

[FM19SS] comment goes here
>FM19SS/- comment goes here

THe first one is the old GRID format (Must be 6 bytes with brackets)
The second one is the new Grid format and the /- indicates a HOUSE Icon.
Other Icons are

/> car
/< motorcycle
/[walking person with HT
/; Tent (portable)
/Y Sailboat
/V ATV station
/^ Airplane
/s Boat
/j Jeep
/R Recreation Vehicle
/t ruck
/v Van

And the THD7 can only display 20 chars of comment text but the D700
can display 28 characters.

292. [aprssig] PCsat GPS is ON and working well!

From: Bob Bruninga <bruninga@usna.edu>
Date: Fri, 11 Jan 2002 11:00:07 -0500 (EST)
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-56604-2002.01.11-10.29.50--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

PCsat is now downlinking $GPGGA positions every 30 seconds on both 145.83
and 144.39 at 1200 baud. It is maintining lock on 10 to 12 satellties
consistently. Mobiles should see it in their station LISTS.

As of 1540z the 145.83 side should even see the DIGI ICON with "S" overlay
showing it as a SPACE digiepater.! We will try to do the same for the
144.39 side but that wont be able to reconfigure till 1900z.

To better get the attention of folks we may again shift the callsign from
W3ADO-1 to PCSAT-1 so that it is more noticible on their mobile displays.
W3ADO-1 will still be supported as an ALIAS.

After some initial experimenting yesterday, this morning we enabled the
GPS to downlink $GPGGA on both 145.83 and 144.39 and switched B to 1200
baud. And after uploading new KEPS to the GPS engine on board, it got
lock in 5 minutes. In full sun and with 9600 UHF RX's off we are in
steady state at about 12.5 volts per cell.

This sun should last through 21 Jan and so we hope to keep the GPS on
throughout. But toward the end, we may have to turn the GPS off on some
orbits if batteries go much lower...

I think it is safe to say that we will not use the 9600 baud UHF receivers
on PCsat any more and so long term users should plan on all sharing the
1200 baud uplinks. This is because they must be off in eclipse to save
power, and while in full sun, having them off gives us just enough
additiinal power to keep the GPS on all the time. Therefore, there is

```
little benefit to playing with the UHF uplink.

Still we solicit any one with a special need or application, or remote
travelers to apply for additional special access, messaging and modes...

I own a Visor Deluxe (the Blue one).  I have tried using pocketAPRS
along with a Paccomm PicoPacket dual-port TNC, a 2m HT, and assorted
GPS'es.  The problem comes in with the PicoPacket which generates too
much noise near the HT to be able to receive much.  It transmits ok
though.

I believe pocketAPRS is designed to use either the PicoPacket or the
Kantronics KPC-3+.  This is so that the GPS can be plugged into the
2nd serial port on the TNC, and the PDA can query the TNC
periodically for an NMEA string from the GPS.

As far as the GPS'es that plug into the Springboard slot, you'd have
to ask Mike Musick whether there's support for that.

Another possibility is the 1200/9600 baud TNC that fits in a
Springboard slot, soon to be available from ShineMicro.com.  I have
one in my hands (early unit), and so does Mike.  He was working on
possible support for it in pocketAPRS but I don't know if he's there
yet.  It should allow you to plug the radio into the springboard
TNC, and a normal serial GPS into the serial connector on the Visor.

BTW:  The connector on the bottom of the Visor provides a USB port
and one serial port.  The serial port has _no_ hardware handshaking,
so it's only a three-wire interface, unlike the Palm PDA's which
provide 2 more signals for hardware handshaking.  :-(

www.pocketaprs.com will get you lots of info and I think Mike
Musick's email address.  If not, ask me and I'll send it to you.

What kind of suitcase do you use to carry all that stuff? <GRIN>

I would rephrase your sentence to say that the "pocketAPRS" is designed to
use" The Kenwood HT  where all you do is plug the PALM into the radio.  No
muss, no fuss...

The Palm is a shirt pocket device, the D7 is the equivalent of
everything else (a radio, a power system, a TNC and an antenna system)
But then if you have the D7 and a GPS, with their displays, then you have
everything else just about, and dont need the PALM...

So maybe the best application of the PALM is with the ALinco DR135 which
has the built-in TNC but none of the D7 displays...

OOPS, silly me.  Anyone with a dumb tracker now, with any radio and any
TNC would drastically benefit from the PALM as the user interface...

NEVERMIND my comments.  I was thinking HANDHELD portable stations (great
for a Palm) but overlooking the great additon of a PALM to a mobile with
external TNC's etc.. as a
great step forward..

Crawling back under my rock now...

I just downloaded (now at 1900z 11 Jan) from CELESTRACK the amateur.txt
file and the keps for PCsat for EPOC 02010.5648.... are off by
half an orbit!

I reloaded from 20 Dec, and keps are within a degree of the correct
position (and also as confirmed from the onboard GPS)

But WHO is IGating from Hawaii?   PCsat was over the south pacific and
this is the first time I see data from Hawaii on the worldwide APRS
feed... (I'm on the ahubcentral.net)?

Rendered body type: text/plain
```

```
Greetings,

I am pleased to announce Release 1.11 of TNOSaprs and JNOSaprs.

This latest release allows APRS clients to directly connect to NOSaprs
over the internet, or your local LAN, using standard tcp/ip protocol.

The port allows clients to send APRS information to the internet system,
but NOT receive the deluge of information back. This is ideal for stations
that simply want to monitor for APRS traffic, and nothing more.

This is the first step of a bigger project. I envision expanding the
port so that clients can negotiate what type of traffic they want to
handle, but that's still a ways away ...

For complete details, please visit my website at the following URL :

   http://www.qsl.net/ve4klm/packet/aprss.html

I had heard about the XL, if it is out then Kantronics does not care about
letting anyone know that logs onto www.kantronics.com

I cannot for the life of me figure out why companies have web pages if they
are not kept up to date.

What distance was this communcations conducted over?

I'm really surprised that it was usable over any distance at all. How
congested is FRS in your neck of the woods?

Rendered body type: text/plain

```
PCsat GPS worked flawlessly all day today, but at 2252z the side A TNC
reset due to low power so we did not turn the GPS back on.

The power budget was doing ok all day, but this evening (friday evening
fun time) there were lots of new folks on the bird and all the additional
user load dropped us below 1.18 volts per cell, so we decided to turn the
GPS off for the rest of the night.   We will try to turn it back on at 1140z
for saturday ops.

Continued use of PCsat by all users (at low duty cycles) is still OK.
We forgot to re-enable UI digipeating, so digipeat via W3ADO-1 is
authorized...

304. [aprssig] Update Pocket APRS maps

From: Henk de Groot <henk.de.groot@hetnet.nl>
Date: Sat, 12 Jan 2002 00:38:28 +0100
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-56689-2002.01.11-18.08.17--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

```
Hello All,

For your information.

I updated my homepage with a new PocketAPRS map for France, also usable with APRS/CE and Xastir (Not in
WinAPRS, it seems to be buggy and only take maps with granularity set to 10).

Last time I forgot to tell, also the World map has been updated. Due to a generation error it contained
3 times the same data. Since 1 time is more than enough I corrected this. The map became smaler
obviously...

Like other European maps this map is also based on a WinAPRS DCW map as this is the only vector-map
source I have and which is usable.

You can find the new map, with other maps, on:
http://www.homepages.hetnet.nl/~pe1dnn/
(You may have to reload the map if you have a cached copy).

Kind regards,

Henk.

306. [aprssig] MicroWeather update

From: "David R. Andersen" <k0rx@uiowa.edu>
Date: Fri, 11 Jan 2002 18:05:29 -0600
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-56700-2002.01.11-18.36.57--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I want to give you a quick update on MicroWeather weather station development progress. Noteworthy things are happening on several different fronts.

1) The question I have been asked the most is: "When are you going to have the 1-wire anemometer working?" I'm pleased to say that as of this afternoon it is running on my development station. I've got some things to clean up but anticipate having a beta version ready for distribution next week. My development code is running with a "Version 2" (the one with the 8-DS2401 silicon serial numbers in the wind direction vane) 1-wire anemometer. The "Version 3" (the one you can currently buy at http://www.aag.com.mx/weather.html - it uses a single DS2450 A/D) anemometer code is a very straightforward addition (version 3 is a much better design, in my opinion) and will be available a few days after the version 2 release. If you have a MicroWeather board up and running, and also a 1-wire weather station, I would be very interested in having you beta-test my code. Please let me know if you are interested. A MicroWeather production firmware release including the 1-wire anemometer will follow within a couple of weeks. The rain gauge should be completed on about the same timeframe.

2) I have just recently released version 1.0.1 of the MicroWeather firmware. In addition to the usual enhancements etc. this version includes a bootloader. Now, you no longer need access to a PIC programmer in order to update your firmware to the latest version. Details are in the file uwx101.zip on the project web page.

3) This weekend I will be moving the project web page to a different server. This project has grown beyond the scope of qsl.net. No, Al didn't ask me to move the page, but I feel that as this project has grown in complexity, it has gone beyond the scope of what I envisioned when I first asked him about hosting the page there. I will leave a client-pull thingie at the old page, so that you will be automatically re-directed to the new page when the time comes. Thus, for the forseeable future you will be able to get to the project page by going to http://www.qsl.net/k0rx/uWx. Thanks for the support Al!

4) I am close to opening up orders to international addresses. Check the page late next week for details.

73 and thanks for your interest in MicroWeather!

Dave K0RX

There was a later version of the code for the original TinyTrak
which did support GPGGA.

Your computer clock will be far more accurate if set through
the internet than if you set it by hand off the radio..

HF time stations (WWV etc) are useful if you don't have the
Internet though.

Well, it's there, and it has been there for a while at:

http://www.kantronics.com/kamXL.htm

They have a rather large red flashing link on the opening page too, accompanied by large print text "New Product" and "Now Available".

Ok, enough free advertisement on my part, time for another All-in-1 HT
ad.

73s,

I am going on a cruise in a few weeks and plan to take my
TH D7 and GPS along. We will be visiting Jamaica, Cuba, and Cozumel.

Is there any APRS activity? What about 2M voice?

I may try PCSat, depending on the passes.

Any thoughts?

Wow, everywhere on the planet there is HAM activity from space. You can
use your HT 28 times a day via these satellites:

PCsat	Easy up and down
ISS	very easy up and down IF they are ON
Sapphire	Easy up (but is anyone listening down
Opal (hard to do)	hard up and down (not recommended unless really bored)
UO22	Easy up
UO-14	VOICE Easy up but congested
AO-27	VOICE Easy up but congested (Days only)

ALl of the EASIES can be done with just a 19" whip antenna. The ones
listed as not easy ARE EASY if you have a handheld 4 element or so UHF
beam.

FOrgetting Opal, that is 6 satellites at 5 passes a day each for a total
of 28 passes a day from anywhere.

As a bonefide DX traveler I will give you access to the PCsat special low
power user uplink so that you can come down on 144.39 so that everyone
will see you!

Is there a need to differentiate "connected to the internet but not
gating" from a normal home station? What extra information does
that provide?

Alternatively, you could use the parallel port. There is a third party
driver which you can install on NT/2000 which will allow suitably-written
programs to directly access hardware, including the parallel port.
(It's called DLPORTIO.)

I think the linux soundmodem also supports keying through the
MIDI/joystick interface on most sound cards. I don't know how it
works (I've never tried it).

> Any thoughts?

Wow, everywhere on the planet there is HAM activity from space. You can
use your HT 28 times a day via these satellites:

PCsat	Easy up and down
ISS	very easy up and down IF they are ON
Sapphire	Easy up (but is anyone listening down
Opal (hard to do)	hard up and down (not recommended unless really bored)
UO22	Easy up
UO-14	VOICE Easy up but congested
AO-27	VOICE Easy up but congested (Days only)

ALl of the EASIES can be done with just a 19" whip antenna. The ones
listed as not easy ARE EASY if you have a handheld 4 element or so UHF
beam.

FOrgetting Opal, that is 6 satellites at 5 passes a day each for a total
of 28 passes a day from anywhere.

As a bonefide DX traveler I will give you access to the PCsat special low
power user uplink so that you can come down on 144.39 so that everyone
will see you!

Hi Rory,

If you are in the region of CURACAO, LESSER ANTILLES (NETHERLANDS),
then look for the following IGATE :

  map.findu.com/pj2pz

Contact Bob (VE3MCH) or PJ2PZ himself (I believe he is listed in
qrz.com (not 100 percent sure) and ask one of them how it is setup
and what frequency.

Hi Hamish,

My thoughts only, If I connected to the internet, I could leave
it a few days or a couple weeks.. I would rather someone to see
that I am connected, but I am not operating an I-Gate and cause
someone to alter their path just to make it to me, and then I
disappear on them. It could take them a while to catch the fact
that I am gone, :-)

Robbie

```
Hi Rory,

Sounds like fun. The Th-D7 is a great radio to bring along,
you will be able to monitor VHF marine channels which will have
lots of activity and keep you abreast of your own vessels activities. (if
you have a 2 way VHF bring that! you can hail passing sailboats and other
pleasure craft, listen in on yachts stuck on reefs, etc.)

You will find that FRS frequencies are VERY active as well, many people
choose these radios for ship to shore comms, you can also make island
contacts on these things as you pull in and depart.

Dont forget the AM aircraft band on the th-d7! Lots of small planes
and charters down there. The air to air channels are worth programming in.

For the sats I would use your ships itinerary and aproximate the long and
lat and print out the passes on paper and bring them with you so you can be
somewhat ready. I use a PCsat/ISS pager that beeps on a hot  pass and forget
about the scheduals. You may just program the downlinks in and run them on
scan and when it stops and you hear a packet, bobs your uncle!

There should be plenty of willing birds you can work and you might even play
with the satellites if you get a chance.')

Remember to bring a copy of your ham license with you.
You also need a permit to operate in other countries and you can
get info on this from rac.ca

Make sure all your batts are charged and all of your electronics
are in working order. If you have receipts for the gear I would
recommend that you bring copies. Consider declaring and documenting
the gear on entry so that you can prove you bought it in your home country.
Do not use the stock belt clip for the th-d7 and clip it to your belt, (when
off the ship) put it in a fanny pack or other more secure situation. Dont
get sunburned in the first day!!!!

Have fun. al

Hello All,

For your information.

I updated my homepage with a new PocketAPRS map for Italy, also usable with APRS/CE and Xastir (Not in WinAPRS, it seems to be buggy and only take maps with granularity set to 10).

Like other European maps this map is also based on a WinAPRS DCW map as this is the only vector-map source I have and which is usable.

You can find the new map, with other maps, on:
http://www.homepages.hetnet.nl/~pe1dnn/
(You may have to reload the map if you have a cached copy).

Kind regards,

Henk.

Henk

We support the PDB file format in WinAPRS. In fact, it is my
favorite format now... I am downloading your maps and will look into
why you say they don't work.. The couple I have tried so far seem to
work just fine..

```
The specs to talk the the Garmin GPS units is widely available and
WinAPRS/MacAPRS already supports talking to the Garmin units for
downloading waypoints, tracks etc..

Does anyone know how to talk to the Magellan units to do the same
types of things?

Hello Keith,

At 18:12 12-1-02 -0500, you wrote:
> We support the PDB file format in WinAPRS.  In fact,
> it is my favorite format now...  I am downloading
> your maps and will look into why you say they don't
> work..  The couple I have tried so far seem to work
> just fine..

They only seem to work when the granularity of the map
is set to 10, this is the parameter in the PocketAPRS
Map File Header. When using 10 the points are accurate
to 1/36000 of a degree. The nice property of this value
is that you don't have to scale anything.

The maps made from the WinAPRS maps need a higher
granularity because the points are to wide appart to
store the offers in a byte. I don't want to insert
too many points inbetween since that would increase the
size too much (I insert at most 1 extra point in a vector).
I set the granulatity to powers of 2 and as small value
as I can get away with without causing overflows. If I only
have a small number of overflows I fix those occasions
manually. The maps for France and Italy have a granularity
of 64, the World map however uses 2048.

I think something is wrong with scaling the vectors using
this granularity value in WinAPRS. The values that are
affected by the granularity setting are:

VectorHeader->LeftBounds, multiply value with (granulatity/10)
VectorHeader->RightBounds, multiply value with (granulatity/10)
```

```
VectorHeader->TopBounds, multiply value with (granulatity/10)
VectorHeader->BottomBounds, mulitply value with (granulatity/10)
VectorHeader->LineStartX, multiply value with (granulatity/10)
VectorHeader->LineStartY, multiply value with (granulatity/10)

AdditionalVectorPoint->NextX, after subtracting 127 multiply result with (granulatity/10)
AdditionalVectorPoint->NextY, after subtracting 127 multiply result with (granulatity/10)
```

You see that if you forgot to scale one of them, or forgot
to scale at all, maps with granularity set to 10 still work.

Also note that the PocketAPRS maps produced by me have Version
0x03, i.e. they include the placeholder bytes as described in
the map format document.

To make you feel better, we got this wrong in Xastir too at
the start...

I hope this helps to fix the problem. It would be nice to
switch over completely to this map format as the storage
is much more efficient than the original WinAPRS format.
Of course the price to pay is that its more complex to
program.

Kind regards,

Henk.

P.S. If you wish I can send you a C program of the decoder
and encoder for these maps to study, but I guess this was
already enough information to see what's wrong.

I sent my registration form and check to Brent Hildebrand
KH2Z<kh2z@arrl.net> over 1 week ago and also emailed him with a couple of
questions regarding APRS-SA. I have heard nothing since and it is, as I am
sure you all know, a pain in the a-- haveing to redo the setup each
time. Does KH2Z really exist??

I am having a proble with APRS-SA and my KPC-3 Plus TNC. It works fine
when using the internet connection but not when connected through the TNC
to my ICOM 2340H 2 meter transceiver. The data looks fine when viewed on
the TNC screen but the Position 1, Position 2, Status, etc. screens do not
update. Also I can not send position or status through the Icom. APRS does
not key the KPC3 Plus. Any suggestions would be greatly appreciated!

I'm tryin' to remember would not a KH2 be one of our
territories in the Pacific some where?

Unless you sent it air mail, it might take a while for the mail ship
to get there.

KH2 is Guam, but there have been a lot of hams that started their "career in
hamradio" while stationed at Andersen AFB or Finegyan <?sp?>, came back home, and
retained the call they were issued..

> From: "Arnold 'Arnie' Johnson" <arniej@gis.net>
> Just had a nice PCSAT pass up the east coast.
> K4MLS-1 - 1113 miles

Too nifty!
That pass was my first (successful) attempt at any sort of satellite work. I had been reading a lot about APRS on PCSAT but always figured it was too advanced for my basic skill level.
Finally, I just decided to give it a shot. With just a few days of trying, on my sixth pass attempt, I got in! Since then, I've managed to get two or three more packets through. I'm impressed at how easy it really is to do.
The most difficult part for me is being near the radio (Kenwood D7AG into a Cushcraft AR2 @ 35 feet) and awake when PCSAT is overhead. I can't wait to try out other satellites. This could be addicting.

Matt (k4mls)

In WinAPRS, go to your settings/TNC Type and select Dual Port. Go to settings/TNC and make sure one of the commands is streamev on. Check at the bottom and you should see:
P1 (HF) ~A
P2 (VHF) |A
These are the stream switch characters. Hit F2. It should send a position report on both bands. It actually sends the posit on one band then sends the stream switch character then sends it on the other band. If you watch the Tx LEDS it will almost look like they're coming on at the same time.

If it doesn't send on both bands, the stream switch character may have been changed from the defaults. You can change it with the streamsw command.

337. [aprssig] APRS+SA v2.06 Released

From: "Brent Hildebrand" <bhildebrand@earthlink.net>
Date: Sat, 12 Jan 2002 22:18:27 -0800
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-56994-2002.01.13-00.49.45--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Current version is 2.06 found in APRSPLUS206.zip. The file GPS206.zip can be used to update v2.02 or above to v2.06.

2002.01.12
v2.06 - Additional modifications to TNC, GPS, and TCP tabs to allow the turning off of scrolling without loosing data.
New - New APRSERVE.TXT file. Now allows for comments on the server line.
New behavior for Windows 95/98/ME. Setup will now only show the tab you specify from the Main window.
You will not be able to click between the various tabs of Setup. This was done to minimize the amount of system resources the program uses. This is not an issue on Windows NT/2000/XP, where the old behavior is still found.
New Settings option - Sounds, PlayMorseSync - this will cause Morse code messages to play to completion before the next Morse code message is played.
Update - 16 character Grid Squares now supported in Coordinate Conversion calculator. This should give about 0.00001 degree accuracy to the grid value. Yes, Grid Squares can be more then 6 characters!
Update - new options for the dropdown menus on the Maps toolbar.
Fixed - Out going bulletins was broken in v2.05 do to a modification in a common library function.
Fixed - Status Tab was not showing all non-conforming packets, and some conforming packets without time stamps.
Fixed - Flow Control for debugging DTR/RTS on the serial port.
Fixed - NWS - certain Message type packet constructs were not being decoded correctly.

Thank you for you interest in APRS+SA.

Your registration number for KC7LDV is:

 xxx-xxx-xxx

The current posted version is V2.02, All users are encouraged to upgrade to the newest version.  The
latest versions have the latest bug fixes and most current APRS protocol.  Check the APRS+SA Web page
periodically.  There is also an APRS+SA SIG.  To subscribe, send an Email message to majordomo@k8sn.org.
  Leave the subject blank.  In the body of the message, put: subscribe aprsplus.

Please let me know if you have received this number by return Email

Documentation on-line:  see the Web Docs link on the APRS+SA web page.

339. [aprssig] Questionable web updates...

From: Jeff Brenton <jeffb@csrye.org>
Date: Sun, 13 Jan 2002 02:35:02 -0600
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-57060-2002.01.13-03.05.08--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

```
The Questionable web page has been updated to show SOME of the new
APRS-related projects going on, and to remove a couple of obsolete
files. Newly listed are KR1ST's Cybiko UI Messenger and VE4KLM's JNOS
```

APRS server projects.

I've also fixed a few links that weren't leaving my page's frames properly, and made a few "special" characters acceptable to Netscape users, because Netscape isn't completely up to snuff on certain things.

I'd also like to remind people that it has been 33 days since I had any updates to the digipeater list; Surely, SOMEONE has put up, taken down, or otherwise changed a digi this past month, SOMEWHERE in the world. See the web page for submission rules/requirements and the address to use to get your changes in.

And be on the look-out for common digipeater beacon misunderstandings, such as using a PHG number that ends in '8' when you mean 'OMNI' (should be zero), not having the proper number of leading zeros on an altitude (it's "/A=nnnnnn", so "/A=940" is just a random comment to APRS programs), and it must occur immediately after the PHG number to be picked up by all programs...

All of this is covered in the current APRS/DOS file DIGIS.TXT; check your digipeater's beacon against the tables there, to see why others don't see your digi quite the way you intended... B-)

I've ordered one of 'em.  They're currently back-ordered -- apparently they
were swamped with orders when they ran this deal about 2 weeks before
Christmas.

Full report here when I get mine...

Totally unreleated...  SGC put a pic of my mobile installation  on their
website:
      http://www.sgcworld.com/applications/index.html

I had no idea it was there until I did a Google search last week for
"WA8LMF".
Click the link for "SG230 VW Passat Wagon" for more info.

Hi Jeff,
   Have you got a chance to play with the new Kam XL..there are some issues
that should be addressed,ie., some Commands that need a RESET before they
take affect that where not needed with the Kam+; certain default settings
that are different than the Kam+(HBAUD,SPACE,MARK and Port to name a few).
    Might as well start looking at these issues now before there is an
onslaught of questions later. I have at present not one APRS author
addressing these issues yet........

Rendered body type: text/plain

On Fri, 11 Jan 2002, Tom Clark (W3IWI) wrote about the PCsat GPS data:

> >From the limited data I looked at, I see posting from two windows with good,
> usable data. The first window had 6 points between 15:52 to 15:57 with 10-12
> satellites in lock over Europe. The second window ran from 23:09 to 23:17
> with 6-8 satellites in lock over the US. Data from both windows looks very
> good.

THe data is available continuously (LIVE) from around the world via any of the APRS HUBS (See end of this message for a discussion on which hubs are the more reliable)(Telnet to second.aprs.net or...

> As an aside, the $GPGGA message is designed for driving boat on the water,
> and it really is the best scheme for an orbiting satellite.

The raw MITEL data comes down on 144.39 at 9600 baud but since we do not have anyone listening there at 9600 baud feeding live to the APRS network, after several days of no collected data, we decided to just shift it to 1200 baud and the single $GPGGA on 144.39 where everyone is listening.

If there were dedicated observers that would capture all 9600 baud data on 144.39 in the USA and Europe and elsewhere for this week (we run out of power on 21 Jan) then we would much rather collect as much of the raw 9600 baud MITEL data as we could..

HOW TO GET THE DATA LIVE: (Answered by Bill Diaz to my question):

The most reliable connection can vary depending on your location, and which way the wind is blowing<g>. I would recommend only AHubEast.net, AHubCentral.net, AHubWest.net, and second.aprs.net.

You can check http://www.ahubswe.net/ahub.html for AHub statuses and core servers. Until recently, this site provided good data on the core servers. Connection Data is not available from Second anymore after they removed the ability to access port 14501. The AHub Stat page no longer shows connection data for second because of this.

AHubEast (NA4V) has been very reliable. Mark re-boots every so often, generally just before he goes out of town. He has been up for 1.66 days. Must be outta town<g>.

AHubWest (KB7ZVA) has been up for 5.63 days. Dick does beta testing for me, so he may be up and down.

AHubCentral (N7UKL) has been up for 4.16 days. Ron cannot get to his machine on weekends, and it seems that whenever he has a problem with the Internet, it is on the weekend!

First is not very reliable. Would not recommend using this unless no other option is available. When it is running it provides a reasonalbly clean feed for aprsd.

Second is the most reliable of the core servers by far. Also removes much, but not all garbage. Reboots once a day usually, but it comes back up bery quick.

Third is limiting connects to 50 users only. It stays up for about a day to 2 days. Lots of garbage packets, tnc commands etc. Typical apsd.

```
Many of you know that I am on one of the 28 FEMA Urban Search and Rescue
teams scattered around the country. Recently I did a PowerPoint about my
deployment to the WTC. I went to e-mail a copy to FEMA last week but it was
too big so I had it put on my company server for FEMA to download. It was
suppose to be erased Friday evening. It was not. It will be tomorrow some time.
```

If anyone wants to download it (2 parts - total about 16 meg) go to:

http://www.steffeninc.com/download

It MUST be loaded into the directory C:\wtc or it won't work.

If you need a PowerPoint viewer you can download one for free from Microsoft. Sometimes the music won't sync up properly to the slides due to different computer speeds but you can use the right or left arrow to just ahead the back.

Since I have to present it 2-3 times to fire schools in the next few months I would appreciate any comments (off sig).

Dave
WB0WNX

347. [aprssig] PCsat Operating notes

From: Bob Bruninga <bruninga@usna.edu>
Date: Sun, 13 Jan 2002 10:50:39 -0500 (EST)
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-57085-2002.01.13-10.20.23--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Two suggestions for messaging via PCSAT, ISS, and other Space DIGIS:

1) Usually send MSGS to ALL, so that all can see them
2) If you send a one-on-one message, leave off the SSID. (prevents ACKS)
3) If you hear a digipeated packet right after you transmit even if you personally do not decode it, it was probably you. So no need to keep forcing packets until you get a decode. Most people will hear it.

RATIONALE: Since 70% of the users on PCsat are using a D7 or D700 HT:

1) The Kenwoods will not capture or display messages to other people, so "ALL" lets them read the mail if you just send messages to ALL, and then indicate WHO in the body of the message if it is not obvioius. THis also makes it easier to send because you dont have to keep reloading the TOCALL each time.

2) ACKS via these satellites are not good. THey are rarely successful and only add congestion to everyone else. If you do not use the other stations SSID, then he will still capture the message, but his radio will not ACK it. THus keeping ACK POLUTION down... The D7 and D700 will send one packet a minute automatically for only 5 times, so it cleans messages out of the system quickly.

3) PCsat transmits with only 2 Watts. But it hears as good as you do. THus PCsat will hear your D7 UPLINK 4 dB better than you hear it and PCsat will hear your MOBILE D700 13dB better than you hear it! So when you hear it digipeat your packet, even if you do not decode it, then you were successful and can hold off a bit..

PCsat was designed for HT's and mobiles. But I have to spend each of my passes commanding and my Mobile now has a armstrong BEAM on it, so I ccannot be gathering statistical data on how well PCsat is closing the link to mobile users. SO I hope that some of you are taking good notes and substantial data so that in the end, we can say for certain if 2 Watts on PCsat is good enough or if more is needed.

Agian, a 19" 2m 1/4 wave whip will do better than a 5/8 wave, so we need lots of data to see if it is worth really drilling another hole for the 19" whip in your car for future satelites.

348. [aprssig] PCsat/Mobiles request for data.

From: Bob Bruninga <bruninga@usna.edu>
Date: Sun, 13 Jan 2002 11:59:38 -0500 (EST)
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-57093-2002.01.13-11.29.23--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

THose of you with D7 or D700's in your car or other packet receiveing equipment, we need to konw what your assessment is of the satellite to mobile downlink link from PCsat. (Uplink is trivial, everyone gets in).

But this week only, we are trying to keep the GPS on all the time 1200z to 2300z. On 144.39 NORMAL APRS Frequency, your mobile should receive PCSAT-11 and a DIGI ICON with an "S" overlay on your mobile about 3 to 5 times a day. These passes are occuring from sunup to about noon and about 3 PM to 8 PM. Perfect for commuting times.

Unfortunately we may turn the 144.39 downlink off while we get other GPS data. But if you QSY to 145.830, then you should also see PCSAT-1 as well. But in either case, you should get PCSAT BULLETINS on either frequencies during all passes.

We dont need copies of the data, just how many of the packets you got. And unless you were watching the front panel, you wont know that either! But what we do need to know are comments like these, AFTER describing your station (D7 or D700, etc with Magmount 1/4 wave, or...)
- I see something from PCsat (W3ADO-1, PCSAT-11, PCSAT-1) on every pass
- I see .... on some passes
- I have never seen them...
- My 1/4 wave does much better than my 5/8 wave...

If you have a laptop to capture all packets from PCsat via your mobile, then all we need is : "I copied 35 packets from PCsat on an X degree pass. Or I got 3 Bulletins, 5 positions, 6 status and 10 users...") etc in most cases do not send us the files...

Trying to see if the 2 Watts from PCsat is doing the job, or if future satellites will require more, and if so, how much more...

Mobile/FM Satellite Pass Periods for the week of 01-13-2002. Times are LOCAL times for mid northern latitudes:

```
Sats 06 07 08 09 10 11 12 13 14 15 16 17 18 19 20 21 22 23 00 01 02 03
---- -- -- -- -- -- -- -- -- -- -- -- -- -- -- -- -- -- -- -- -- -- --
ISS_ *********** *                                     * ** **********
UO22 ******                        **********
```

```
AO27     **********                      ***********
UO14       ***********                       **********
OPAL *                      **********                              *
PCsat********* **           ***************
Saph **********             **************
```

Note: Times are LOCAL TIME for MID Northern Latitudes. Use this to
       plan your mobile operations during commuting and distant travels.

The "****"'s above just mean that during those hours you will get 2 or 3 passes daily. Here are some simple rules for PCsat's orbit:

1) You will get 2 to 3 passes during two separate periods per day
2) If you hear PCsat, then you will probably hear it 100 minutes later
3) For high passes, the same pass will occur same time -30 mins each day.
4) Once a week, add 100 minutes to this routine to stay on the high pass.

Notice that for the world Traveler, he is never more than an hour or so without satellite access except for about 1130 to 1300 daily... and assumign someone is "listening"!

I guess I should also do this for down-under...

It's a joke but it is actually on topic. I found it funny and even though it is political it is not funny due to political agendas. I think we would all get a laugh out of this no matter what side we are on. This was forwarded to me my another APRS user privately but I will stick my neck out and post it.

Thanks Kevin!

>>>
Democrats vs Republicans

A woman in a hot air balloon realized she was lost. She lowered altitude
and spotted a man below. She shouted to him,
"Excuse me, can you help me? I promised a friend I would meet him an hour ago, but I don't know where I am."

The man consulted his portable GPS and replied, "You're in a hot air balloon approximately 30 feet above a ground elevation
of 2346 feet above sea level. You are 31 degrees, 14.97 minutes north latitude and 100 degrees, 49.09 minutes west
longitude."

She rolled her eyes and said, "You must be a Republican."

"I am," replied the man. "How did you know?"

"Well," answered the balloonist, "Everything you told me is technically
correct, but I have no idea what to make of your
information, and I'm still lost. Frankly, you've not been much help to
me."

The man smiled and responded, "You must be a Democrat."

"I am," replied the balloonist. "But, how did you know?"

"Well," said the man, "you don't know where you are or where you're
going. You've risen to where you are due to a large
quantity of hot air. You made a promise that you have no idea how to
keep, and you expect ME to solve your problem.
You're in EXACTLY the same position you were in before we met, but
somehow now, it's MY fault!"

Looking for reasonable priced used GPS units to build trackers out of for
local club...
I am also looking for parts to setup a digi in southern middle Tennessee.
Any help would be great.

355. [aprssig] Sapphire may be authorized for Digipeating?

From: Bob Bruninga <bruninga@usna.edu>
Date: Sun, 13 Jan 2002 13:51:50 -0500 (EST)
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Cc: TAPR APRS Special Interest Group <aprssig@tapr.org>
Message-ID: <LYR842-57122-2002.01.13-13.21.52--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

For planning purposes, Sapphire may be authorized for UI digipeating under the same user guidelines as PCsat. But since it was not designed for this mission, we need assurence that users will not burden it with unauthorized "connects".

We have been holding off on this secondary mission until we see that all operators have gotten the word and understand that for the safety and long life of these satelites (PCsat, Sapphire), that users must not attempt connections TO or THROUGH these satellites.

We still see occassional connect attempts and until those individuals get the word we cannot proceed with authorizing this additional on-orbit capability. We only make this announcement for planning purposes for those operators with big trips planned.

Our goal is to get as many satellites as possible acting as UI digipeaters for the mobile, and handheld traveling user worldwide... OPAL also has a digipeater, and we understand that users may attempt to digipeat via the callsign of KE6RFX 9600 baud for the purpose of trying to quantify its usefulness.

But since it is simplex on 437.100 it takes -/+ and +/- 10 KHz doppler tracking and takes some planning. But maybe it appears hard because we dont really know the exact center frequencies of the uplink and downlink? This is a good area for experimentation too. It does send a periodic telemetry packets.

Rendered body type: text/plain

Hi,

I want to install APRS and other reporting systems in a mobile home. This mobile home has solar battery charging and some other systems including security that I would like to be able to monitor.

I would like to have it so that it beacons the status of certain conditions like battery voltage, photovoltaic charging rate, internal temperature etc. Perhaps it could be made so I can Poll it and request battery voltage etc. I would also like the ability to do certain things remotely: turn on a genset, turn on a light, run HVAC, activate a two way radio system for the talking car effect.

For general security I will install motion detectors and a simple mercury switch to indicate towing. I want immediate notification of these events as they occur.

I guess I will need a 486 cpu and a TNC and relays and sensors and stuff. I have looked at a program called "misterhouse" but it seemed a little gimmicky. Ideally this system will run on DOS.

Does anyone have experience with using APRS to automate things and send command codes to things?

73, al

ALL of this can be done with a KPC-3+ by itself... NO PC...

> I guess I will need a 486 cpu and a TNC and relays and sensors and stuff. I
> have looked at a program called "misterhouse" but it seemed a little

Dont need any PC at all for what you mentioned above... Its all in the TNC. That is how we built PCsat... BUT...

If you do want to use a PC and dont have a KPC-3+ or need a full 8 bits of on/off functions, use an old DOS laptop. APRSdos supports the OUT xxxxxxxx comand to flip bits on any LPT1 printer/parallel port...

But unfortunately, APRSdos does not ahve the analog telemtery of the KPC-3+ or the MIM module. YOu could add a MIM module for the 5 channels of analog values... though...

On Sun, 13 Jan 2002, Jesse wrote:

> Not to sound stupid but what is the local time for mid northern
> latitdudes?

Nope, its a good question. The relationship between the orbit of PCsat and the seasonal angle of the sun only changes a few degrees in a week's time. Yes, the earth rotates relative to them, but the relationship is fixed. Thus everyone at the same latitude will see about the same thing at about the same "local time" as they spin into view of the satelite orbit.

THus, for the purposes of this weekly prediction which only tells you the timeframes of passes (not the exact time of each pass), then these timeframes are the same for everyone at the same latitude as the earth spins..

For example, the ORBIT of PCsat right now is almost perfectly aligned with the TWILIGHT line worldwide. This relationship changes little in a week. Everyone on the planet passes under the orbit of PCsat at the same "local time". But where PCsat is along that orbit can be anywhere +/- 50 minutes. But in general, everyone is seeing PCsat passes within about +/- 2 hours of sunrise and sunset.

THis is also why we are now in FULL SUN for these two weeks and basking in full power...

Help - I am finally trying APRS in my car, having already done it
at my home QTH, marine mobile, and airmobile. I configured my PK-
12 to be N3HGB-9 and set the path to APRS VIA RELAY, WIDE, WIDE and
set to transmit every 60 seconds. I tried it from home and it popped
right up on FINDU. I have now driven to work (yuk!) in Baltimore
and FINDU has picked up NONE of my trip. if I go to www.aprs.org
and look at live VHF I can see my trip perfectly. What it up here?
Do I need more wides? Would RELAY, WIDE4-4 be better for a car?

We are doing in-theatre denial. And that's all I know (and all I have
Need To Know) about it. Extrapolating, I assume they're dithering the
signal on some of the satellites while they're in-view of the theatre of
operation, leaving perhaps 1 or 2 birds available in the Coarse
Acquisition (L1-C/A) realm available for accurate timing and code-phase
acuisition. That will allow even the older L1/L2 P-code receivers to
lock clocks and start the tracking sequence on the P/Y signal for
Precise Positioning System acquisition.

The gotcha now is that we have to use P/Y gear in-theatre. If we deny
2D/3D fixes on L1-C/A code phase, civil receivers cannot get a fix,
while the military (P/Y-code) receivers should be able to.

And now I'll stop speculating.

The Dallas Semi weather station was 'taken over' by a company out of
Mexico. I've not dealt with them, but I've not heard anything bad. Other
than some shipping delays. They even kept the same price. You can find
links to them on TAPR or Dallas Semi web sites.

Joe - I keep my boat at the mouth of Middle River on the NE side of Baltimore.
I find that a path of relay, wide, trace2-2 seems to work fairly well, both in
the boat and in my truck when I drive around the area. I tried a shorter path
and like you didn't get into FINDU as reliabily. Maybe the extra hops are
needed to get to an IGate.

Why not look into the Radio Shack WX200/Oregon Scientific WM-918?  For about
the same cost as the Dallas Semi 1-wire you get a heckuva lot better value in
my opinion.  More sensors are standard, nice indoor display unit, out-of-the
box PC connectivity, much wider range of supported APRS platforms.  Okay, so
there are a few extra wires to contend with, big deal, what's another 3-4
```

wires up to the roof when most hams already have dozens! You can still find these on eBay new-in-box with the PC software and cable for about $175. No significant difference in the quality of the sensors (unless you end up with a finicky temp unit which is a known bug). That's the cost of the basic Dallas unit and I don't think it includes rain bucket or software.

Just a suggestion.

Joel

Presuming you have checked the DUAL PORT TNC option on the SETUP, MAIN screen, then reports will be sent to the ports indicated depending on the path you have selected. I.e., If you do COMMANDS, UNPROTO PATHS you can set paths and select which one will actually be sent. The PORT 0 sends to both VHF and HF sides, PORT 1 send to HF only, PORT2 sends to VHF only. In other words, you can have paths set for both HF and VHF, but the PORT setting determines which one will actualy be sent.

Hope this helps. If you are trying to do something else by toggling the TNC, could you tell me what it is you want to accomplish and perhaps I can help with that problem.

More data:
On the way home from Woodlawn to Kent Island FINDU seemed to pick up at least 1/3 of my transmissions. Coverage wasn't too bad once I got to Ferndale.
(http://www.findu.com/cgi-bin/track.cgi?call=n3hgb-9&start=60&length=60) .
There was NO coverage with the exact same setup going the other way.
Must be igates going up and down. Here is a question: The live JAVA map at www.aprs.org seems to get me the whole way there and back. It hears me, it's connected to the internet, but it doesn't send over to FINDU? I may a little fuzzy on the interconnections.
73 and thanks all!

I have the pico packet that has the RG-45 plugs on the front not the serial connection on the back, with the slid on battery pack. can someone point me in the right direction for the conections to get it connected to a Jornada 680? Prefer to use the active sync cable into the pico if possible.
Thanks

```

They take PayPal. I placed my order at night - it shipped in the morning.
AAG sends it with the instruction "signature required" so have it sent to an
address that's occupied during business hours.

No. That is an old javAPRS web page hooked to a dumb tnc and old DOS PC.
It has no way to feed the internet. Sorry...:-(

Bob

Greetings,

HTML and RTF versions of the NOSaprs documentation are now available on my website below :

http://www.qsl.net/ve4klm/packet/aprss.html

The RTF is BIG (8 meg, yeesh), so it's available in both Winzip and compressed Unix/Linux formats. Please let me know if you have any problems with any of the files.

Cheers

Maiko / VE4KLM

```
I am currently trying to hack a Symbol Pen Terminal to do aprs with. It has
a VGA screen, Serial Port, IR, keyboard port (power!), full keyboard, 4 megs
of ram, and rom-dos on a 2 meg flash ram. The one I have has the 802.11
wireless with it. I found someone who was selling bulk ATA 64MB flash ram
cards for 20 bucks on ebay so it will have 64 megs of data space.
I am thinking that I might remove the wireless card and add another 64MB
card in the internal slot, don't see why not. Symbol has the pin outs for
the ports and EVERYTHING on their website (PDF)

Also anyone know where I could find a cable for this type of jack? It is
funky so I might have to rewire it to a DB-9 and cut a hole in the back of
the unit for the serial interface.

Have pics up on my website. Just waiting for the flashcard to arrive.
qsl.nwt/ke4tvv

btw here is the link to the auction, only one thing, the screens are EM and
you have to buy the pens add., but he includes a handful when you do. He
told me he has a bunch and these would rock for packet/APRS.

No, he is talking about my local javAPRS page which is updated every 2
minutes by a PCNFS file transfer from an old DOS box running a QQBasic
program over to  our UNIX WEB host...

The www.aprs.org he refers to reflects to my main page :

  http://www.ew.usna.edu/~bruninga/aprs.html

which has a link to my live javARPS page...
(I think it is called radio.html or something like that...)

381. [aprssig] Help w/APRS-CE

From: Mark Dieterich <mkd@cs.brown.edu>
Date: Mon, 14 Jan 2002 15:14:23 -0500
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-57286-2002.01.14-14.44.14--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

```
Folks,

I hope someone can shed some light on what's going on here...

First the setup:

I have an IPAQ running APRS/CE, a KPC3+, and a GPS connected to the KPC3+ on
the aux serial port.  The setup runs just fine with a laptop, so I'm sure the
KPC3+ and GPS are functioning properly.  If I connect up the IPAQ, I can
communicate w/the KPC3+ fine via a serial connection (tricking the IPAQ into
thinking it is talking w/a modem and just bringing up a terminal window), so
I'm convinced the communcations channel between the IPAQ and the KPC3+ is
working.

The problems:

- I can't get the IPAQ to update my own stations position info.  The KPC3+
will feed the gps sentences back to the serial port when I enter CTRL-E and I
have set up APRS/CE to send this character.  I tested via a terminal window on
the IPAQ and it does see the four LT buffers returned after a CTRL-E is sent.
My only thought here is that APRS/CE is being confused by the four buffers that
are returned?  Anybody using a KPC3+ in this fashion with APRS/CE?

- The other problem I have is that I can't seem to get the INIT files nor
the RESTORE file to work properly.  I can see the KPC3+ answering EH? as it
is being fed commands.  I know that the APRS/CE internal commands are being
accepted, since I see my status message change after starting the program.
I've even tried really simple INIT files (one liners with a simple command) and
the KPC3+ balks at this also.  I must be doing something stupid here, but don't
know what.  Any suggestions?

Hoping to be free of the laptop soon :)

Thanks,

Mark

The Ultimate Trekking Device?
Garmin Mates Satellite Mapping Features to a Radio

http://abcnews.go.com/sections/scitech/TechTV/techtv_rino020111.html

L A S V E G A S, Jan. 11 — For the wilderness junkie, GPS (global positioning
system) and FRS (family radio service) are on the list of gadgets that will
keep you on track and in touch with your group.

It only seems natural that the two technologies would be found in a single
hybrid device. At this year's Consumer Electronics Show in Las Vegas, Garmin
unveiled its first device to serve exactly that purpose.
Named RINO (Radios Integrated Navigation for Outdoors) because the
dual-antenna design makes it look like a rhinoceros, the 110 and 120 series
```

devices include both FRS and GPS functionality.

While FRS radios are popular, they have a limited two miles operating range. So, Garmin also adds GMRS (general mobile radio service) capability which allows for two-way communications at a distance of up to five miles in an unobstructed environment.

However, an important issue related to GMRS is Federal Communications Commission licensing requirements. The FCC requires consumers to file for a $75 license good for five years — before operating a GMRS radio. Broadcasting on a GMRS frequency without a license may result in a fine of up to $10,000.

While the range of GMRS devices is impressive, that additional licensing cost may not be for everybody. You'll still be able to use RINO, but you'll be limited to the license-free FRS frequencies.

Broadcasting Words and Coordinates

No two-way radio would be complete without support for multiple channels. And RINO offers 14 channels for FRS and 14 for GMRS, each with 38 sub-channels. The resulting 532 channel combination means that users will have a higher likelihood of finding an unused channel just for their particular group.

With the RINO's GPS features, you'll be able to track your path during your adventure and retrace your steps. But the best feature of RINO is peer-to-peer positioning. Utilizing the gadgets' two-way capabilities, you'll be able to transmit your exact location to other RINO users. Group members can determine your relative position and display the information on the 160x160-pixel display.

Garmin claims the RINO will run for 15 hours on three AA batteries.

Other Handy Features

You navigate through the functions with two buttons and a joystick. We found that the controls were too small to be used with gloves by cold weather adventurers. Considering its additional features and waterproof design — the RINO can be submerged in one meter of water for 30 minutes — we still think the product is innovative.

The top-of-the-line RINO 120 includes support for maps with detail, including major cities and highways to street level, topography, and bathymetric data. Storage is limited to 8MB, so you can only download the specific area you're traveling in with the range limited by the detail you require. Garmin provides maps of North and South America on a CD and a cable to connect to your PC.

For additional security, the RINO 120 also includes a scramble feature that makes eavesdropping more difficult.

First Impressions

For the avid outdoor adventurer, the RINO appears to provide everything you need to stay in touch with your group and on the right track in a very portable 8-ounce (RINO 110) or 8.5-ounce package (RINO 120). Despite some usability concerns we have, the RINO is a truly useful tool, and the feature list is impressive.

Pros: Integrated GPS with two-way radio; maps included (RINO 120); peer-to-peer positioning.

Cons: Small navigation keys.

Company: Garmin
Price: $211 (RINO 110) and $311(RINO 120)
Available: April 2002

PCsat Volts were ok at 15.5 so I left GPS on overnight (east USA time).
Thus, later passes over western USA will have GPS and also Europe tomorrow
morning if it holds up until we get it back at sunrise Tuesday.

Look for $GPGGA data on 145.837 downlink
Look for MITEL 9600 baud data on 144.39 worldwide and send me any capture
files pleease....

Thanks!
Only 6 more days of full sun...
Seeing lots of new calls showing up now...

Do you think it is a good idea to mix modes that cannot detect each other's
DCD? Understand you might be between a rock and a hard place but in general I
think it is not such a good idea to do this. The 1200 baud ground stations are
going to be transmitting on top of the satellite.

Then again, this is ham radio so maybe stuff like isn't a big deal.

```
I talked with a Garmin tech on the phone Friday, but here's what he told me (not the brightest bulb in
the lamp, but better than nothing...)

1) GPS transmitted on FRS only, not GMRS
2) can setup to beacon the GPS periodically without user action
3) received posits are passed through the serial port/PC cable, probably as $GP sentences
4) he *thought* the GPS info was transmitted over the air sub-audibly - I am not so sure

More tech info should be available this month, and I have petitioned my company to go to Garmin as a
potential solution integrator and reseller - might have a proto in my hands next month ;-)

2) can setup to beacon the GPS periodically without user action

Okay... Modifications are done everywhere. BUT, I thought I read somewhere that to be in accordance with the upcoming regulation that these devices MUST ONLY transmit GPS with user action. That doing it without user action would void type-acceptance.

I wonder which it is in reality.

4) he *thought* the GPS info was transmitted over the air sub-audibly - I am not so sure

Again, as I understood it, it would be audible, but the transmission had a NTE (not to exceed) timeframe...like not more than 1 second per x seconds.

I *obviously* need to re-read some of this.

Yes, that is what we planned. See the design approach in the PCsat articles in QEX and 73 magazines and on the WEB page (below).

THe normal APRS satellite user channel is 144.827MHz 1200 baud digipeater (Up and down). THis can be accessed with an HT (Kenwood THD7, or any combo of HT and TNC) and all mobiles. This channel is worldwide..

THe 144.39 downlink is for message delivery to any North American APRS mobile or handheld operator anywhere in the country who may be temporarily out of range of the terrestrial network. It can also be used for national bullettins and special (infrequent) events. To this end, all data intended for terrestrial users of 144.39 is transmittted at 1200 baud as one would expect.

During the brief experimental times (this week for example)) when we need GPS data, we downlink that on 144.39. Since it is only 2 packets every 30 seconds, we use 9600 baud (tiny packets) to not only save power on the satellite, but also to minimize any terrestrial interference. THis data is not intended for users and so we designed it so that all terrestrial Users and digipeaters will ignore our -122 dBm signal from space and continue operating normally.

Thus, by design, the 1200 baud terrestrial users TNC's are supposed to ignore our .3 second bursts and use the channel normally including transmitting on top of us..

We have no problem receiving the weak data even on a busy 144.39 channel due to space and time diversity of multiple receivers receiving the data. We chose to use 144.39 for APRS data since it was already coordinated throughout the North American continent and that way we would not be a hog of the very precious and limited dedicated satellite channels limted to 145.8 to 145.99 MHz of which then we only needed one, instead of two.

Even in the busiest APRS area (middle east coast for example) the 144.39 channel at any one station's location still hears a 30% or less busy channel.. With just 4 monitoring stations across the country we have a 99% chance of getting every packet without collision.

Rendered body type: text/plain

I have an Alinco DR-135T with internal TNC. I am trying to set up an APRS station as a Digi using WinAPRS 2.5.1. Is anyone on the SIG using this setup? I cannot determine what the TNC type is. The info that came with the Alinco does not give an idea what it emulates. I am also having a hard time getting the setup right to have it seen as a digi. If I use my call and a -1, I cannot send a test message from my call (KD4NUE) to my digi alias (KD4NUE-1), but it seems to be able to relay info. My message list shows q as acknowledgment; not an a. If I set my call as KD4NUE, it is not recognized as a digi. I can do a Control T and see that info is being routed through me, but I don't show up in the protopath of any of the stations going through me.

Maybe I am trying to think packet and not APRS, but everything I have tried so far doesn't seem to be getting the setup right.

I am new to APRS, and I am in a location that could use some help. I got this setup so I could try to help fill a void in the area. I planned on dedicating this setup as a digi, but don't want to slow things down with an improper unproto setup.

Any advice/suggestions appreciated.

David

It's the web author/developer's responsibility (highlighted, double exclamation point!) to ensure the web site is viewable by the majority of users. This means they MUST code and test their web pages for the average/lowest common denominator of WORLDWIDE users. As a MINIMUM this means being compatible back to IE 4/NS 3, and NOT limiting or demanding that a user have proprietary plug-ins, script support/nonstandard graphics formats. We in the US often assume that everyone has the latest giga-box with more video RAM than the average cars horsepower - worldwide probably the AVERAGE low end user is still down around a P-233 and 4 megs video. Sure, you CAN have flash and scripts and all that fancy stuff, and even cater to the very latest release of IE or NS, BUT you should interrogate the users system and adjust content based on their needs, NOT the ego's or assumptions of the web site. Don't forget, many places in the world you pay by the byte and it's VERY expensive, plus you might be limited to a slow 33.6 connection. I live less than 20 miles line-of-sight from downtown Seattle, but can't buy a DSL or cable-modem connection to save my life!

As far as the FCC is concerned, I wait anxiously for the shrewd lawyer who is going to sue their pants off in a class action suit. Government web sites are REQUIRED by Federal regulation to be accessible to the widest cross section of user as possible. The FCC, by limiting access to only Netscape users, is flat out illegal and should be called to the carpet.

The only way to compel web authors to adhere to the accepted standards is
1) let them know their site should be designed to accommodate as many users as practical - this means VENDOR NEUTRAL CONTENT and TESTED for the current low-end standard user's hardware/browser
2) BOYCOTT commercial sites that refuse to accommodate the masses - let them know you'll spend your money elsewhere
3) for private sites like FINDU, use tact and SUGGEST they consider redesigning the site to provide better worldwide accessibility. Many of these web authors take offense and feel beggars shouldn't be choosers, but might not fully understand the big picture.

ACCESSIBILITY is IMPORTANT - it is the equivalent to handicap parking, wheelchair ramps, and Braille signs on elevators.

There are LOTS of places in the US that receive hand-me-down computers from corporate/government upgrades, e.g. many small schools & libraries might not have anything if older PC's weren't donated. They can't afford the latest gee-wiz boxes.

Unfortunately it'll only get worse before better as any buffoon can buy Frontpage or any of the popular web tools, but these almost never produce code that is compliant with current W3C standards, and few take the time to learn the correct way to code and test HTML.

This will give you maps that read out on IE but no list of heard stations.

>Read a report over the weekend that said that Netscape was used by 27.3
>percent of all on line....... so I guess it's screw the other 72.7 per
>cent......

Ummm, hate to tell you this, but Netscape+IE does not equal 100% of the market. The lower we can get that number the more likely we are to have web pages that work for everybody.

>SORRY Jim it just burns me when the needs of the many or over look
>for the needs of the few..

So, do your part and try one of the other browsers. Let web site owners know that IE and Netscape are not the only ones on the scene.

Bill

<soapbox kicking mode>

Rac> It's the web author/developer's responsibility (highlighted, double
Rac> exclamation point!) to ensure the web site is viewable by the majority of
Rac> users. This means they MUST code and test their web pages for the
Rac> average/lowest common denominator of WORLDWIDE users.

There is a key word missing from the above - "PROFESSIONAL", inserted in front of "web author/developer".

As one, I can tell you it's a PITA to accomodate "all" users. Books are written on the subject. Compatibility charts abound. And, guess what? It's still damn near impossible to optimize a site for more than a couple of browsers in any reasonable amount of time.

I had $1500 of billable time last year, discovering and documenting the incompatibilities between the Java installations of Netscape 4 vs. Netscape 6 vs. Internet Explorer 5.x vs. IE 6, and between the Windows and Linux/Unix counterparts, for a SINGLE WEB SITE. It paid for the parts and labor to install a lift kit on my Jeep... B-)

It was finally decided that the only way to guarantee that all features worked was to require Windows-based IE5 or later clients accessing it, because the alternative would have cost more programming time than the rest of the site had. NONE of the other browsers implemented everything correctly, even though the output of the web site was 100% W3C-compliant, using Netscape-compatible Javascript.

Guess what? Sites don't always work "right", even with the browser(s) they're tested with. I have received complaints that the Questionable web page doesn't display right in (pick a browser), even when I've tested it with IE 4/5/5.5/6, Netscape 4.5/4.7/6.0 for Windows, Netscape 4.7/6.0 for Linux, Mozilla 6, Opera 3/5, and even the browser in StarOffice 5.2. Personal choice of fonts or colors can greatly affect the display of elements.

Rac> As a MINIMUM this means being compatible back to IE 4/NS 3, and
Rac> NOT limiting or demanding that a user have proprietary plug-ins,
Rac> script support/nonstandard graphics formats.

I agree on this - my machines don't even have Flash or Real Player installed, because I can not find anyone willing to discuss the possibility, let alone details, of potential security exploits, of some of these popular tools. And I've got 99% of internet sites defined as "restricted", to reduce the ability of sites to corrupt my system... which means some sites have NO accessible content.

Rac> We in the US often assume that everyone has the latest giga-box
Rac> with more video RAM than the average cars horsepower - worldwide probably the
Rac> AVERAGE low end user is still down around a P-233 and 4 megs video. Sure,
Rac> you CAN have flash and scripts and all that fancy stuff, and even cater to
Rac> the very latest release of IE or NS, BUT you should interrogate the users
Rac> system and adjust content based on their needs, NOT the ego's or assumptions
Rac> of the web site. Don't forget, many places in the world you pay by the byte
Rac> and it's VERY expensive, plus you might be limited to a slow 33.6 connection.
Rac> I live less than 20 miles line-of-sight from downtown Seattle, but can't buy
Rac> a DSL or cable-modem connection to save my life!

Although I design towards non-broadband users, I'd say, "Turn that first line around!" A whole hell of a lot of internet USERS ass-u-me that anyone who has the time, money, and passion to put up a web page on a given topic ALSO has the time, money, and energy to SPARE from their lives and hobbies to present that site "properly" to "every" internet user.

Want universal and fast? Check out this link:

http://dididahdahdidit.com/text/digis.txt

Presents the subject suscinctly, displays the same in all browsers, doesn't assume fast connections, no plug-ins needed for ASCII-compatible browsers, all the requirements. Doesn't even use HTML tables, which weren't always done "correctly" in certain famous browsers.

It also doesn't look particularly "peppy", doesn't make use of highlighting that could make certain elements of the topic stand out so that their importance isn't discounted, etc.

Rac> The only way to compel web authors to adhere to the accepted standards is
Rac> 1) let them know their site should be designed to accommodate as many users
Rac> as practical - this means VENDOR NEUTRAL CONTENT and TESTED for the current
Rac> low-end standard user's hardware/browser
Rac> 2) BOYCOTT commercial sites that refuse to accommodate the masses - let them
Rac> know you'll spend your money elsewhere
Rac> 3) for private sites like FINDU, use tact and SUGGEST they consider
Rac> redesigning the site to provide better worldwide accessibility. Many of
Rac> these web authors take offense and feel beggars shouldn't be choosers, but
Rac> might not fully understand the big picture.

At the professional sites, I'd be willing to bet that a large number of them really do "understand the big picture". And they made conscious decisions on where to spend their time based upon that picture.

Rac> ACCESSIBILITY is IMPORTANT - it is the equivalent to handicap parking,
Rac> wheelchair ramps, and Braille signs on elevators.

Accessibility is a big word, with big implications. Are you going to complain about a site that takes true accessibility into account, fully implementing the features of Cascading Style Sheets to support non-visual web browsing environments, as well as low-vision compatibility, just because your web browser doesn't properly implement the CSS standard? Or are you going to complain to AOL about how Netscape 6 is less compliant with CSS2 than its competitor Opera?

Rac> There are LOTS of places in the US that receive hand-me-down computers from
Rac> corporate/government upgrades, e.g. many small schools & libraries might not
Rac> have anything if older PC's weren't donated. They can't afford the latest
Rac> gee-wiz boxes.

And there are a lot of schools that refuse to take ANY computer donations, because their staff doesn't want to deal with less than state-of-the-art. Our local public schools didn't want to teach typing any any computer that didn't arrive in a factory-sealed box from Compaq, Dell, or IBM. So they passed over donations of hundreds of computers that fall into the categories you mentioned...

Rac> Unfortunately it'll only get worse before better as any buffoon can buy
Rac> Frontpage or any of the popular web tools, but these almost never produce
Rac> code that is compliant with current W3C standards, and few take the time to
Rac> learn the correct way to code and test HTML.

Any fool can create a web page - and many do. Tools just make it easier for fools and professionals to work. And most web tools (FrontPage excepted) provide W3C compliance test tools.

Compliance with W3C standards breaks browsers. Make your code 100% compliant with HTML4/CSS2 standards, including recommendations, and it won't work in IE3 or NS3 if you're trying to change fonts, because the way you "used" to do that, the way most non-commercial sites STILL do that, is "depreciated" in the new standards.

I think this has been discussed before. The reason for this is that in order to put all the stations on
the MapBlast map the URL becomes rather long. Microsoft has implemented a limit to the URL line length
for some reason (out of specification, there is no limit) and thats why you don't see anything. Netscape
 doesn't have this limit or has a much higher limit than IE.

So instead of demaning this to work on any browser think for a minute. It is not possible to implement
this with MapBlast in a way that it works on IE. If you find out otherwise I'm sure Steve will be very
interested to hear from you.

Kind regards,

Henk.

Its not our fault.  MS Internet Explorer just cannot handle the long URL's
that FINDU uses to get the maps from MAPQUEST.  Netscape happens to not
care about the length of the URL...

I am frustrated by this also, but the best thing to do is write Microsoft
a letter and explain to them that their Browser has a bug in it...  I use
Internet Explorer too, but have to use Netscape to look at those maps.
But most of the time, I am not interested in the maps, so MS-IE is fine..

In the end, HTML 1.0, works fine on all browsers.  If you want to create a
magazine article or a newspaper, there are people that will pay you for that.
```

There is very little information (not advertising) on the web that is not best presented a simply structured text with appropriate graphics (use links to pictures if you really want to be nice to those who are bandwidth limited).

On Tue, 15 Jan 2002, Jeff King wrote about dual use of 144.39:

> OK... thanks for the explanation. Kind of a layer cake approach. I like it.

And for what it is worth, there was actually another idea for channel sharing for an APRSAT that we designed to go to a near geostationary orbit. It RECEIEVD on 144.39.

THis seems ludicrous at first blush, becasue the frequency in north america is jammed with dozens of collided packets per second (and a satellite would hear all of them at once).... But these are all aimed more or less at the horizon and using 50W or less stations. And the satellite is up at about 45 degrees over the central USA, where all of this energy is about 6 dB or more down.

So we theorized that a mobile with a 300W amp and a roof mounted turnstyle antenna with a main lobe straight up, would be able to just hit the bird (40,000 km away) and still be at least 16 to 20 dB stronger than the noise level of all the other 144.39 traffic... (whcih could not possibly be decoded)..

The advantage being that those special mobiles would be transparently able to hit the terrrestrial system and/or the satellite without any operator intervention..

But that was the mission we got bumped off one week before integration...
(And also back when we thought there was no way we would ever get a 2m frequency from AMSAT in the satelltie sub-band and so we were looking at other ways to share frequenceies)

Bob

Any book on HTML (more precisely, HTTP) will tell you that there are

hard limits on GET operations, the most popular way to display web
pages. It isn't just the browser that limits the length of a URL;
servers do, too.

You should not count on being able to send more than 200-300
characters as part of a GET URL; in fact, many of the security
problems with web servers COUNT on long URLs breaking something in the
web server.

POST operations allow more information to be sent to the server as
arguments, like call signs, locations, etc. But, you can't bookmark a
URL that uses POST. More precisely, you CAN bookmark it, but it won't
store the variables used to make the link work.

>URL that uses POST. More precisely, you CAN bookmark it, but it won't
>store the variables used to make the link work.

But you can create a <FORM> that uses POST, and set the variable with the long
string in the form and just provide the user a submit button. If the server
supports POST access, this is the easiest way to do complicated URLs and just
provide a page with the button that the user can bookmark.

Here's an example. You can put text on the button as you see fit...

```
<form type="GET" action="http://www.mapblast.com/gif">
<input type="hidden" name="CT" value="36.15250:-95.99117:8000">
<input type="hidden" name="IC" value="36.15250:-95.99117:100:W5GGW-7">
<input type="hidden" name="FAM" value="myblast">
<input type="hidden" name="W" value="456">
<input type="hidden" name="H" value="259">
<input type="submit">
</form>
```

If MS would stop trying to make IE incompatable with Netscape, things would
work a lot better. Remember, MS purposely tried to screw up Java, but a
judge had to slap their hand. Now they intend to drop Java completely.

Remember, MS purposely screws with the hard disk settings so it is very
difficult to run dual boot.

MS has shown again and again that it will make its software different just
to confound competitors. MS is 90 percent to blame, netscape maybe 10

percent.

Gee just like the FCC.....

Read a report over the weekend that said that Netscape was used by   27.3
per cent
of all on line....... so I guess it's screw the other 72.7 per cent......

SORRY   Jim it just burns me when the needs of the many or over look
for the needs of the few..

John, W0JAB

Exactly, Steve did this for us and for fun in his spare time. LIke
anything else in HAM radio, be happy when it works. ANd also like in ham
radio, if you can do it better, then do it. The live source data is
avaiable to anyone anywhere to write any kind of APRS web page from the
LIVE streaming data... so go for it...

I think Steve's work is great! and am happy to find a way to read it...

THink of it. 10 years ago, Who would have thought that you would get live
access to your amateur satellite data anywhere in the world for FREE!

Bob

```

```
Anybody else having problems with 2 meters being exceptionally
noisy?  Both my car and my house stations are currently having difficulty
copying packets unless they are extremely strong -- like my car within half
a mile of the house!

        I tried driving the car towards the nearest digi (20 miles away) and only
copied a very few packets through the local digi, and nothing from the
house once I was a mile or so away.

        Both stations normally have fairly good range.

        Thanks,
        Earl

Assuming I can ever get my TTII to work, what would be a good "mayday"
setting for an aircraft. I had thought of using MAYDAY <Aircraft callsign>
in the status beacon and using a path of WIDE7-7 with a 20 second repeat
rate. Would this work? Is there some APRS standard for distress? Would
people believe it if they saw it or think it was a hoax. Obviously I
wouldn't want to test it or even send WIDE7-7 from the air normally. Would
that be counterproductive to put so many wides in anyway?
Thanks,
Joe

         Works like a champ here.  As always, every computer is different
and it can sometimes be a real headache to get something to work right.  If
you really want to use AGW with W2K, and you're having problems, it just
takes a lot of tinkering to overcome it.

         I was very fortunate, it worked the first time here.  You
experience is obviously different, but perhaps you can get it going in the
future.

Rendered body type: text/plain

The Australian National APRS Server aprs.net.au will be off line for a
period of time between 0500utc and 2000utc on the 17th of Jan.

This is due to an IP address change and subsequent changes to the DNS server
etc.

If there are problems with the DNS server change, you will still be able to
connect to the server AFTER the above outage times if you use the dedicated
IP address of 202.12.147.52

Eg 202.12.147.52:10151 to access the APRS Server.

Regards

Richard

I am in the process of updating the connections file for the second.aprs.net server. Once I have an updated list, I will coordinate with the other two core server sysops to make sure we have a common set.

Below are a list of currently inactive Igates for which I have no information. If you are affiliated with any of these Igates, please e-mail me directly with proposed activity and contact information. I know some of these are quite old and have been defunct for some time, but I would like status confirmation before I permanently delete them.

423. [aprssig] Kenwood TM-D700

From: "Doug Henry" <dhenry@skyweb.ca>
Date: Tue, 15 Jan 2002 22:52:32 -0600
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-57499-2002.01.15-23.21.31--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I'm looking for some tips to get the Kenwood MCP-D700 software to work with
my new TM-D700. I'm using a DB-9 null modem cable between the radio and
computer. I'm connected to Com1 with the following parameters:
Bits per Second: 9600 (I've tried the other transfer rate options too)
Data Bits: 8
Parity: None
Stop Bits: 1
Flow Control: Xon/Xoff (I've tried Hardware and None too)

The radio is setup as TNC APRS on Band A with VHF/UHF Ops on Band B. When I
try to read data from the radio I get a window that says Reading Data from
Radio but before anything happens it is replaced by a Communications Timeout
Error message.

Tnx Doug

>The radio is setup as TNC APRS on Band A with VHF/UHF Ops on Band B.

The TNC config on the THD7-A has to be in plain APRS or OFF to work.
Make sure that you have the correct cabling.   Try swapping pins 2 and 3 on
your DB-9 just to make sure you need a null modem (which I know you do, but
perhaps there is another part of your cabling that has already switched 2 and
3.

Rendered body type: text/plain

With the Mic_E (conpressed packets) I see them on the screen as an
asortment of characters which the aprs program decodes into posit
info...Is there a way translating these symbols? Other than by APRS
programs?   an example if they are in a log file?

> computer

You don't need the null modem; only a gender changer!   [Or a straight-through 9-conductor serial cable with a DB-9 FEMALE on both ends. Radio Shack sells these -- I actually got one once in a small town RS in western Iowa when I got fed up with the kludge of gender-changer, AT-modem cable and and 25-to-9 adapter that I had been using on a cross-country trip.]   The time-outs you are getting is because the TXD lines of both devices are butting heads instead of going into the RXD on the opposite device!

Kenwood has been knocked repeatedly on various APRS, computer and packet lists and web sites for the idiotic decision to put a MALE DB-9 on the radio. It should have been FEMALE (like an external modem or TNC) so that a standard computer-to-external-modem cable would have worked . About half the new users automatically assume that since BOTH the PC and the radio have MALE connectors on them that you must need a null modem.

Rendered body type: text/plain

Glen,
W0IBM14,WIDE2-2:/999/144.49+3/145.8 -3/R=02362/mode-V appears to be a defective packet.

The source call W0IBM14 should be followed by ">" rather than ",". WinAprs flagged this packet since it is not AX25 compliant.

The basic elements of an AX25 packet in TNC2 display format are: Source>Destination,Via:Payload.

The source call is seperated from the destination call with the ">" character.

A source call cannot exceed 9 bytes (including SSID) and should not contain any punctuation other than "-" character.

If ">" is not present or is found more than 10 characters from the start of the packet, WinAprs considers the source call to be defective.

HTH,
Bill KC9XG

Doug-

The MCP-D700 program works when the D700 is in normal mode. You cannot have
the D700 in APRS mode & get ANYTHING from the DE-9 connector. If you are
wanting digital data on the DE-9 connector, it must be in packet mode . We
have complained to Kenwood about this for 2 years, but they have a deaf ear.

good luck - 73
Craig
N7TSZ

Hi Doug,

While looking at the answers you've received so far, none seems
to directly address your question as stated..

The Kenwood software is for setting parameters in the D700, like
frequencies for memories, PL tones and anything else you would do
from the front panel. It is not a program for decoding packets
and communicating with other stations.

Obtain a straight through cable as mentioned, plug the cable in
to the computer and radio and turn the radio on. Never plug the
cable in while the radio is on, according to Kenwood.

Now, start the Kenwood program. Click on Read the data..
Everything that has been stored in the D700 will fill in the
Screen displayed on the monitor. Change or modify anything you
desire, then Write to a file on your computer for safe keeping,
and then write to the D700 if you are satisfied with your
changes..

If you want to run aprs software, connect the cable as above,
turn on the radio, place the radio in "Packet" tnc and then start
your aprs program.. Or for that matter, any "Packet" program, or
terminal program.

Good Luck and 73

Robbie

436. [aprssig] The Power of PCsat (& ISS)

From: Bob Bruninga <bruninga@usna.edu>
Date: Wed, 16 Jan 2002 10:31:30 -0500 (EST)
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Cc: TAPR APRS Special Interest Group <aprssig@tapr.org>
Message-ID: <LYR842-57543-2002.01.16-10.01.36--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

The Power of PCsat (& ISS when on):

Walk outside with a packet HT, and send a message when PCsat(or ISS) flies over. It will get to anywhere in the world to anyone LIVE within seconds! Here are two examples:

```
  KM4HG>APRS,PCSAT-1*::WB4APR   :HI bob.  Sending this via PCsat
```

This one will go to [wb4apr] anywhere on the planet live assuming the recepient has his radio on and is tuned to the local APRS frequency in his area.

```
  K4HG>APRS,PCSAT-1*::EMAIL    :joe@juno.com Hi joe! Sending this via Sat
```

This one will be delivered by Email to the email address included in the message (joe@juno.com for example).

What triggered me to post this email was when I got home last night I just happened to look at my laptop that monitors the local terrestrial APRS frequency and I saw the above message from KM4HG on MY screen. At first, I thought, that is impossible, since I never used that laptop or that radio for aanything but 144.39, and never tuned to the satellite and he does not have access to the uplink for the 144.39 downlink.

Duh... then I realized "the power of PCsat".... Since any packets digipeated by PCsat (or ISS) are picked up by various SAT-Gates and injected into the worldwide APRS internet stream, then if the packet is a message to someone, it will come out the other end -live- back to RF in -his- area for delivery on his local APRS frequency anywhere in the world!

Of course, one should be more -amazed- when it does work, then when it doesnt... after all, this is HAM radio. But it shows the power and potential of PCsat and ISS and any other digipeating satellite for getting the message out AND DELIVERED via the amateur satellites and Satellite monitoring satgates for the traveler...

So for fun, instead of sending your boring Gridsquare or posit, try sending someone an Email via satellite! from your packet station.

Format for the data portion of the packet is:

```
    :EMAIL      :email@address.here and message goes here
```

Where the EMAIL field is padded with 6 additional spaces...and the leading and ending colons are required.

Have fun!

438. [aprssig] New Station setup help needed

From: k9soa@att.net
Date: Wed, 16 Jan 2002 16:00:54 +0000
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-57548-2002.01.16-10.30.46--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Just getting started in APRS and was interested in
setting up a home station and maybe a digipeater.
Currently working on my car unit with TinyTrakII, Garmin
eMap, Yaesu FT-2600M but having a little problem getting
into any system. Going to have to use a system at home
to find out what is not right with the mobile unit.
There is an IGate about 20 miles from my home but even
when I am within 2 miles of it, it still can't see me.
The fun of something new.

What software and hardware do I need besides the
transciever. Going to a hamfest on the 27th and see
what I can find.

439. [aprssig] WinAPRS2.5.1 Objects and the TH-D7A(G)display

From: "Wade Blake" <wade.blake@noaa.gov>
Date: Wed, 16 Jan 2002 10:8:49
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-57550-2002.01.16-10.38.48--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I'm running WinAPRS 2.5.1. When I create stationary objects on WinAPRS
(zero speed and course/direction), and make them "active", they are
transmitted out. When the TH-D7A(G) receives these "objects", the name and
location are correct, but the "course" shows up as 519 degrees and "speed"
of 999m.

Any thoughts.

Thanks, Wade, N7LGK

         Normally, they don't cause any problems like that, but
occasionally the three gravity amplifiers get out of balance (similar to a
class B amp not being biased correctly) and they cause all kinds of things
when that happens -- thunderstorms, earthquakes, and the like.  In fact,
those things flying from Nevada over California out into the Pacific Ocean
have caused some memorable times!  <G>

THe CSE/SPD fields of an APRS position or object packet are shared fields
and can be relaced with free text if the object or station is stationalry.
But if you put numbers in the free field replacement, then the radio will
still interpret them as CSE/SPD..

442. [aprssig] IRLP and APRS - Can we do cellular like service? I think so.

From: "Brian Webster" <radiowebst@yahoo.com>
Date: Wed, 16 Jan 2002 13:37:14 -0500
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Cc: "IRLP" <irlp@lrlp.net>
Message-ID: <LYR842-57570-2002.01.16-13.03.07--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Well finally got around to looking at the IRLP repeater linking system after Bob Bruninga was throwing ideas out. Wow, what a linking system and listening to the audio feed on the internet I must say I am impressed with the quality! Those of you who haven't looked at this new mode yet check out www.irlp.net it is very informative.

That being said I got thinking about cellular like service for amateur service.

Being an engineer on a cellular project I have some background about the inner workings of the systems, here are some of my ideas to throw out for discussion.

- We could use APRS in conjunction with IRLP to give it some smarts. You could use APRS positions and create a server that has more GIS type functions. That is, create shape files/coverage areas on a map for each IRLP node/radio. Once this is completed a person running APRS could send a message to the APRS system such as ?IRLP this message would run a query of their lat/long against any coverage areas of known IRLP node/radios and if you are located within a coverage area it would send a response back with the frequency and PL tone if required. This could further be refined to be able to query for a specific band by using something like ?IRLP2 for 2 meters or ?IRLP4 for 440 band sites.

- The next problem would be knowing which radios were linked to the central reflectors or another node direct. That might get a little more difficult, read the IRLP pages and throw some suggestions out there.

- This type of system would allow all users of different flavors of APRS and radio combos to be able to work. I'm sure Bob would be able to figure out a way to make those Kenwood's do some whiz bang extra things but that would just be a plus for those who have them.

- The harder part of this is getting someone to write some software that acts as a server to keep the coverage plots of the IRLP nodes and has the smarts to run the individual position queries against that data. Not impossible but well over my head. Any programmers out there that can do this real easy?

-from a user perspective this could be fairly simple to run, I do think that the IRLP nodes should start adopting a different numbering system to plan for growth. I suggest using the local area code phone number system, then use the last four digits for multiple nodes in an area. This would also allow people without net access to check on nodes to be able to guess at a node for an area by just knowing the area code and phone exchange and then start with a number like 0001. Node numbers would then have an ID something like 2122250001 for NY city area (212)225-0001 being a local type phone number on the public phone system. This could probably work to bring up a group of nodes if required.

- The next logical step in this process would be to start going digital on the radio side of the house. This may not be as hard as we think. There are radios out there now that are designed to meet the APCO 25 standard. If we start using that digital standard we could buy radios off the shelf now. Not sure if the Part 97 rules allow this but should be easy enough to get changed since they are always pushing spectrum efficiency. Radios that meet this standard are also backward compatible to analog systems, so they can be dual role. If we have IRLP nodes that are digital they could be linked to old analog repeaters and this would allow for an orderly migration over time.

- For emergency communications this IRLP network could be a net controllers dream. Since the data stream is on the net it would be very easy to create a software based console and net control station that could bring up any node and with headset and mic talk to any one of them. This would obviously have to be restricted in some way but not impossible. Think of the possibility of being able to get on any repeater on the IRLP network from any broadband connection. You could incorporate additional features like linking of different sites, audio patching to other locations like FEMA or any other required places that have a computer with sound card and broad band connection. The internet is not the holy grail of communications solutions but since it does not have any one single point of failure it could work to complement our abilities. People who are not in an affected area could actually run nets and route voice traffic from their home. That taps a huge resource of people without having to make them travel.

-These are just my thoughts and are meant to get a serious discussion and possibly a start to this type of project. I know there are the people out there to make this a reality. Just takes some effort to get standards and groups together to work on each element.

-Let the discussion begin!

443. [aprssig] Re: WinAPRS2.5.1 Objects and the TH-D7A(G)display

From: CDR Wade Blake <Wade.Blake@noaa.gov>
Date: Wed, 16 Jan 2002 13:53:41 -0500
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Cc: TAPR APRS Special Interest Group <aprssig@lists.tapr.org>
Message-ID: <LYR842-57571-2002.01.16-13.23.49--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

These eroneous course/speed values appear both times when a value of 0 is entered for both, or when the "0" is deleted and made blank when entering the Object to be created. When a non-zero value for speed is entered, that seems to get formatted and passed in the outgoing packet (object 3). Entering a value for course 180, speed 0 for object 4, does not send out the course/speed fields, and the D7A(G) can't correctly interpret the packet for course/speed. See the 4 test objects' packets below.

So the question is, how does one indicate, from the WinAPRS-side, that the object is stationary, so the Kenwood handheld sees it that way? I presume the D-700 probably does the same thing?

```
>xmit To VHF>TEST     *161831z3850.61N/07714.46W/ test object
>xmit To VHF>TEST2    *161831z3851.00N/07715.00W/ test object 2
>xmit To VHF>TEST3    *161834z3852.00N/07716.00W/270/005 test object 3
>xmit To VHF>TEST4    *161844z3853.00N/07717.00W/ test object 4
```

As far as APCO 25 radios are concerned, there are more than Motorola making them. Transcrypt/Johnson is one, I think uniden is and if we get enough interest the protocol is either published or available by license, I'm not sure which. It is a good path to look at for digital on air protocol though.

Recently my D700 has developed a quirk on UHF. At random times the transmitted audio is reported as very garbled, distorted and unreadable. It seems that this coincides with a dimming/flickering of the display backlighting.

I have checked the usual suspects of power and antenna connections. The problem exists irrespective of the power setting. Have tried two different antennas and the problem returned after a week or so on the new antenna, which is a Larsen mag mount 2-70.

I wonder if this might be a problem with loose fasteners in the various PC boards etc inside the beast? Seems like that has been a problem with various rigs in the past. I fixed my IC-22S years ago by tightening the PC board/shielding screws.

Maybe a couple of raps on the case the next time it goes flaky might narrow things down a bit! Anyone have the same experience or am I venturing into new territory here?

Tom,
  I have that problem only the receive side of things. Everyone tells me I'm fine but the "busy......"
flashes and it hard to understand people. I'm new to ham so I though maybe that was simply futter, maybe
 not.

```
Appearantly Handspring (maker of the Palm clone with the springboard
slot)... has made the decision to drop the Handspring device in favor of
their Treo device... with the Springboard slot being left behind in the
process....

I seem to remember seeing a neat DSP based TNC mentioned here.... that used
the springboard slot.... I hope they can find a different niche for their
product...

Here is a web site to read about the APCO 25 radio standards, it is supposed
to have an open standards so there doesn't have to be a sole provider for
equipment.

http://www.apcointl.org/project25/information.html

Just quietly, I like your style! :) Nice to see some fresh ideas coming
around. Oh, and please tell more about this flavour of digital voice you
mentioned. :)

One day, IRLP like technology will grace our microwave bands, and large
parts of our network will be independent of the Internet... :)

>process....

It gets worse.  The Treo is a GSM Phone/PDA.  The base model costs (will
cost) $399 plus a monthly service charge ($40 to $50) not including an
ISP.  The base price is more if you don't order the service at the time of
purchase.   The upgrade model will be $600 plus a monthly service
charge.   Treo's will probably only go to Europe in the near future, since
GSM services are limited in North America.  Right now they can't even ship
a product.  There is no firm release date for the Treo.

Apparently the CEO of Handspring, Donna Dubinsky, is charting her company
into the same waters as so many other companies trying to make their money
in the "value added" market.  Unfortunately, these waters are reef and
shark infested.  And it's apparent the Handspring company will crash upon
those rocks.    Donna Dubinsky and Jeff Hawkins will survive as
multi-millionaires and get away in a fancy speedboat, while several hundred
Handspring employees will be left as shark-fodder.  They'll lose their
jobs, their pensions, their stock options, their health insurance...   Not
to mention other stockholders and the $50 million they scammed out of Qualcom

Who the heck is gonna pay $600 for a phone plus another $500 to $600 per
year for access fees?  Especially if you need another ISP to get the web
functions...   This looks like a deliberate attempt by the executives of a
company to bankrupt that company while stealing millions in "salaries" and
"bonuses" in the process.   Good work if you can get it.

I was really leaning towards buying a Visor, but now, I'm gonna get an iPaq
or something similar.

73,

Mark

In this instance, it might, but there are a lot of things that Mozilla (and Netscape 6) does NOT work with, that Opera, NS 4.x and IE 4/5/6 do work with... I know, because I had to figure out WHY they didn't work!

All browsers have trade-offs.

I can do that on my Kenwood D7, and D700 radios right now.

Where are the Yaesu, Icom, Alinco, and other manufacturer's designs?

Are they all waiting for APRS to die? It's not going to happen anytime soon.

I think all these manufacturers are missing the boat. Alinco has kind of gotten their toes wet with the TNC in a radio design, but they need to jump right in and get their hair wet too!

Bob has been hashing this over for a while now. It is possible to implement, but it will take quite a bit of time and effort.

As for figuring out coverage areas, good luck. It's hard enough getting approximate locations for the repeaters from the owners.

> - The next problem would be knowing which radios were linked to the central
> reflectors or another node direct. That might get a little more difficult,
> read the IRLP pages and throw some suggestions out there.

No problem at all, this is already done. See http://status.irlp.net

> I'm sure Bob would be able to figure out a
> way to make those Kenwood's do some whiz bang extra
> things but that would just be a plus for those who have them.

Bob spends a great deal of time figuring out work-arounds for the Kenwood radios. How about we tell Kenwood what we need, and they change things on their end!

> I do think that
> the IRLP nodes should start adopting a different numbering system to plan
> for growth.

David suggested back in October that a new number scheme was in the works, as we currently have room for only 1000 nodes.

> - For emergency communications this IRLP network could be a net controllers
> dream.

IRLP works great for ARES communications. Right after we installed the Edmonton node, it was used for emergency communications with a city 90 minute south of us. A train derailment caused an evacuation of a large number of residents. One of the main ARES coordinators was in Edmonton for a Flea Market. He was able to keep tabs on the evacuation via IRLP.

As you have seen in other responses, the impetus is to stay with radio to radio connections. Most EOCs should have radio systems in place, so adding an IRLP node to the local repeater would allow access. As a side benefit, the local amateurs have a toy to play with on the repeater during non-emergency times. Besides, what is an EOC needs to contact an operator in your local area? Having an internet only access point isn't going to help. IRLP nodes that are bi-directional give they best bang for your buck.

> It would be area code+1 digit number for the node you want to connect to+pound
> to bring up the node, and when you're done you would press area code+1 digit node
> number for that node+star to bring down that node.

I have suggested that we only require a single number assigned to each node. Currently we use a system like the one described above.

However, there is no need to go to the trouble of specifying which node is to be disconnected. IRLP only allows one-to-one connections. Even when a node is connected to a reflector, it is still only a one-to-one connection, except that the reflector is a special type of node that can handle mulitple connections at once.

We have to specify which node we want to bring up when initiating a connection, so that the computer knows who we want to connect to. However, once that connection has been made, there is no need to specify which connection needs to be broken.

I have a quick disconnect code programmed into the two nodes I look after, which will drop any connection.

For example, using the scheme described above:

1231# connects us to node number 1231.
Why do I need to specify 1231* to shut it off? I can't shut down a link to another node, since only one connection is allowed at a time.
If I punch in 1342*, IRLP currently will shut down the active connection.
Any valid off code will shut down the current connection. That's also why my quick disconnect code (73) also works.

If we move to 4 digit node id numbers, we can accomodate 10,000 nodes. 5 digits will give us 100,000 nodes. One single easy to remember code will shut down any one of them.

My 2 cents worth...

http://www.kyocera-wireless.com/kysmart/kysmart_series.htm

The market is there. I buy 'em for my staff. A phone/palm combo does wonders to remove a geek's "belt-weight" <g> while providing an additional level of connectivity for them that I've found increases personal productivity well beyond the cost of the unit. ISP costs are $9/month for me...and invoking it allows a function called "sync-via-web" in which one no longer needs to hot-sync using the shoe...for that truly unteathered experience.

Ev, W2EV

460. [aprssig] Re: How PCsat looks on the D7 HT

From: Bob Bruninga <bruninga@usna.edu>
Date: Thu, 17 Jan 2002 09:01:08 -0500 (EST)
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Cc: TAPR APRS Special Interest Group <aprssig@tapr.org>
Message-ID: <LYR842-57687-2002.01.17-08.31.17--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Regarding seeing PCsats live moving position on your APRS HT:

```
> 5th screen:
>  +------------+
>  | 1:PCSAT-1  |
>  |alt 802206M |  <== PCsat at 802,206 meters (802 km)
>  |cse--- s---m|
>  +------------+
```

I forgot to mention that to see the live satellite altitude on your HT
display, you need to have "units" set to Metric. Other wise it will show
999999 feet because 2,646,600 feet wont fit...

462. [aprssig] Re: WinAPRS2.5.1 Objects and the TH-D7A(G)display

From: CDR Wade Blake <Wade.Blake@noaa.gov>
Date: Thu, 17 Jan 2002 09:03:38 -0500
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Cc: TAPR APRS Special Interest Group <aprssig@lists.tapr.org>
Message-ID: <LYR842-57689-2002.01.17-08.36.10--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Unfortunately, on the TH-D7g, ALL the objects appear to have a course and speed
associated with them.
"TEST", "TEST2", AND "TEST4" are on course "519 degrees" at 999 mph. "TEST3", shows
up correctly as on course 270 at 5 mph.

In the examples, what are the "first 7 bytes"? Are they the items after the
longitude?

It appears that the D7AG doesn't know what to do if there is no   /ccc/sss items
after the longitude, where ccc is the course and sss is the speed. It seems that if
WinAPRS places zeros in those items, all should work fine, such as
".../07714.46W/000/000 test object". But there does not seem to be a way to get
WinAPRS to put those in there. It was probably done that way to reduce transmission
time. WinAPRS seems to understand that when those fields are nonexistant, the object
is stationary, whereas the Kenwood looks for and calculates a course/speed, even

though it's not there.

It seems the "fix" would be for WinAPRS to put the "zeros" in for speed and something like 000 for course.

Thanks for your assistance. Any other thoughts from anyone?

Rendered body type: text/plain

PCsat Status and planning:

* On 16 Jan at 2220z PCsat RESET and turned off the GPS.
* We will turn GPS back on at 1945z 17 jan and try to keep it ON through
Sunday at about 2000z. After that, it wont be back on again for months...

I discovered it had reset this morning when I got to work. At first I
thought it was due to low power, but now realize I was so complacent just
monitoring the previous 58 hours of continuous GPS up-time, that I forgot
to send up the commands to clear the 72 hour watch dog timer. Duh...

We will be back into eclipses starting on Tuesday or so, but sun angle
is hopefully improving and if we make it throught the 35% eclipses in Feb
we may make it to the next 2-week full sun period in Mid June.

We hope to support digipeating at all times except when telemetry shows
11111111 or when notified via bulletins of a power crunch...

468. [aprssig] RE: [IRLP General] Numbering system and selctive calling an individual

From: "Brian Webster" <radiowebst@yahoo.com>
Date: Thu, 17 Jan 2002 12:11:53 -0500
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-57710-2002.01.17-11.38.43--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

```
Takes Bob's idea of left justification a little farther and the desire to do
selective call of an individual. There has been mention of sending an
individual PL tone to call a person and allow them to keep the radio muted.
>From the repeater aspect that is very difficult, DTMF signalling is not that
hard however. I also think that there are quite a few radios that are
capable of DTMF selective calling. The harder part is just getting some
repeaters to pass through the DTMF strings, many are configured not to pass
it, easy fix for most I believe.

So if you have the option digits set to be slective call then you could have
your radio muted until someone wnats just you, this would also allow for
group calls as well. Good for skywarn and the like. The IRLP equipment and
software might need a little programming but that should be possible to I
would think.

Cc: wd8oep@yahoo.com; irlp@irlp.net
Subject: Re: [IRLP General] I'll try this again

For my two cents, I asked that future node numbers be left justified and
that provision be made for any additional right digits to be passed along
```

to the distant node for local use. Thus we allow for future scalability.

For example, if I send 435 I would get node #435.
If I send 4356 I wouild get Node #435 and "option 6" at that node
If I send 435678 I would get Node #435 and "678" are passed along for
   local use at node #435. Specifically, I would use the "678" for
   activating a local PL to an end user or something like that...
   But that is a local option at that node...

Thus, to transition to 4 digits from the current 3, I would suggest that
the current node #435 would become #4350

Thus it could respond to both #435 and #4350 now because both are passed
to node #435. Thus the first element of IRLP software upgrade would have
all the nodes accept the LEFT most 3 digits and the 4th (and capture any
trailing ones as well)...

Once all that is in place, then the next round of software upgrades
Transmits the four digits (and all extra digits) for this future
expandability.... but other neat ideas can be overlayed later withut
requring everyone to get new code, because the extra digits are passed
along already...

>travel.

This brings up a point that may have been discussed here, But I don't
remember the final outcome.

When you do an I-gate query on VHF in this area (PHX) the I-gate
dumps everything it sees as an I-gate to VHF, including all of those
on TCP-IP. This is not only unusable, but also destructive. It floods
every digi in range with a solid stream of packets and the resulting
chaos denies service to the whole APRS frequency for up to 20 minutes.

There have also been instances where a station has done this more than once.
The first time may be an accident. After that, it is deliberate
interference. We need to be able to stop this. I hope that this
message doesn't give any pranksters ideas, but we do have an Achilles
heel in APRS.

Are the software authors working on this problem? It seems to me that
a mobile should be able to do a simple query to see if he is reaching
an I-gate without bringing the whole local part of the system down.

This list is primarily a 'hobby' list - there are many more commercial users
who demand a different standard of product out there.

In Aug '96, I was using a Nokia 9000 GSM cell phone in Europe that opened to
reveal a 386 (I think) PC.  It was a unique product that I used in a
commercial environment for a telecommunications security function.  I was
one of the first owners in the country.  My MONTHLY cell phone costs were
far more that your estimated ANNUAL cost for this product - the purchase
```

price was insignificant in relation to the fact that I could save 10 times
the annual costs by early alert and response to a single fraud incident. At
that time, it was an excellent technical solution to a commercial challenge.

Sure, a free phone and $20 monthly service is all that many users need - but
there is a market for other products and services. A few years ago, some
here might have been saying 'who the heck is gonna pay $xxx for an HT with
TNC' - now it is being suggested here that manufacturers are failing by not
providing these technologies.

"Who the heck...."??? Me for one - if the costs are justified! If YOU
don't want it - don't buy it - but don't knock those that do~! It's not
nice! Certainly the cause of product development is not promoted by
unfounded (and possible actionable) allegations of theft.

At 05:52 AM 1/17/02, Ev Tupis (W2EV) wrote:

>The market is there. I buy 'em for my staff.

It's great for certain niche markets, but the user base and service areas
are too small, the number of competing formats is too large. I had a Casio
IP800 6 to 7 years ago and loved the thing, but I could not get clients and
co-workers to text page me, even upon request. And I made it easy by
writing a little script in my shell ISP account that looked for a key word
in the email subject line and then forwarded it on to my pager - so they
didn't have to go to PageMart's web site and remember my pager ID.

If you are waiting for the TREO, it is a this point vaporware, with no firm
rollout date. And all initial production is slated to go to Europe.

In the case of Nextel which I mentioned, iDen has been a failure in the
general populace. I have never seen an average Joe Public walking around
with an iDen phone, the only people carrying them are tradesman and truck
drivers. And the people I know who have them say the only reason that they
have the iDen phones is because Nextel took away their trunked HT's and
FORCED them to go iDen. My brother works for a company that uses iDen
service, but he leaves the phone in his car on sales calls because their
installers like to call him with the Walkie-Talkie function and use
"colorful" language. And as I pointed out Nextel would've bankrupted
itself if it hadn't hitched its wagon to Motorola.

Also look to satellite radio, despite high initial purchases and 30,000
people pre-signed for the service, XM radio still requires something like a
subscriber base of 2.4 million paying accounts to break even. Does anyone
honestly think that will happen? And what happens when and if Sirius
comes on line? It's going to pull subscribers away from XM and make it all
that much harder to succeed.

Mark

The results of an APRS IGATE query should either comply with the APRS
spec. or be supressed IMO.

Unfortunately, some IGATEs, Hubs and Servers respond with overly long
messages which often violate the spec.  Some sysops seem to delight in
constructing these huge SPAM messages.

Presently, repeated queries from a mobile will not only SPAM the local
RF channel until it is unusable, it can clog the APRS IS as well.

IMO, an APRS IGATE query from a mobile should result in APRS query
responses from IGATEs heard direct, or within several hops.  Responses
received by a mobile along Interstate 80 from an IGATE or Hub in Budapest,
Hungary provides no useful information to the user initiating the query.

IGATES have the ultimate responsibilty for determining what is gated to
the local RF channel.  It would be nice if all IGATES had the ability to
supress the transmission of these IGATE queries from mobiles to the
Internet.  This would eliminate the problem entirely if implemented at
```

all IGATES. Unfortunately, even if every author provided this capability, it would be years before legacy applications without these features disappeared from the network.

IMO, IGATE queres that originate from a station connected to the Internet should result in responses from all IGATES connected to the Internet, but under no circumstances should these be gated to RF.

I do not think it is fair to place the blame on the users/sysops. That is a resource that cannot be controlled and the default assumption is if they can do it, they will do it, regardless of the consequences on the system as a whole.

None-the-less, a mechanism is needed, and to be effective, that mechanism needs to be a choke point. Trying to individually enforce the spec on 600,000 hams across the U.S. and x,xxx,xxx? worldwide is like trying to herd that many cats. So, the only alternative is for the APRS-WG to actually do what they say they were going to do and introduce a certification process for the authors/programs. Telling the authors what to do is also like herding cats, but at least you have a chance, and frankly the term "APRS Certified" would seem to me to be a valuable trademark any author would want on their program.

Unfortunately, this would require the people on the WG to grow a set, as it might be a unpopular move for some (you get scratched herding cats), yet clearly it is the only means and in any case, was a promised action of the WG some years back.

And before the naysayers come out and say someone outside the WG needs to write a spec for them to look at, this really is not required and is just more delay tactics. Yes, it would be nice to have a compliance test suite, but this is not required to assign the "APRS Certified" logo. By default, this could be assigned to every existing program, and when problems are found, as in this example, the author could be contacted to fix the problem else the "APRS Certified" logo would be revoked. Carrot and Stick worked for Teddy Roosevelt and it could work for the APRS-WG. You just have to have a set here.

-Jeff

Hi Clark,

Just for info. all aprsd Igates respond to the query. However, the Ahub servers don't. They merely pass what they hear, and it never goes RF unless a local asks for it. As an Ahub sysop, I monitor that sort of stuff and track who abuse it. If it happens too many times... it's not an accident... agreed. I have never had to xlist anyone in my region, but I wouldn't hesitate. It would be unfair and cruel to put anyone thru that process. Xlist means being removed from Igates and digis. Hope it never comes to that.

Rendered body type: text/plain

I see Kenwood has released a new version of the D700 PC software (works with W2K and XP) ......

however I have only be able to read the radios settings with this new version. Get a connection timeout error with trying to write changes back to the D700.

Seems like I am always "beta" testing these software packages using the COM ports !!

A patch for aprsd to fix this was supplied by (I think) the folks in Wyoming.
I don't know if has made it in to the cvs code at source forge.

I've lost (aka mis-filed) the patch and would appreciate a reposting.

Hi All!

I intend to connect an external TNC2 to my TM-D700. But in the manual I
cannot find a note about the pin which is the input line for PTT! Which pin
can I connect to the ptt-output from tnc2?

That doesn't change the fact, that in this situation, the IGATE query
is not only useless, it is dangerous. RF APRS stations need to be
able to do a query and find out who's out there. It is the Gateway
that needs to filter out the I-gates heard on TCP/IP and respond on
RF with only it's own call. We can't just shrug this off and advise
people not to query for IGATEs.

N7AAC

I think they call it "standby" instead of PTT.  It's pin 3 on the 6 pin
mini-din.

Hi Wolf,
You have my curiosity as to why an external tnc2 is going to be
used! But on page 8 of your manual is a pin layout for the D700
microphone.. No numbers for the pins, but it is plain which is
what..  Good luck es 73

Why would an ?IGATE query even be passed to the APRS internet system to begin
with ? Is that the way it was originally envisioned *back then* ? Shouldn't the
IGATE itself just deal with the query on it's own, and not even pass it on to
the APRS internet system ?

Rendered body type: text/plain

```
PCsat is spinning counterclockwise if you are looking up towards the
bottom in the northern hemisphere once about every 102 seconds with a
slight wobble.  (Like a top spinning but with a slow wobble)  The wobble
is on the order of 5 minutes or more...

This doesnt tell you much, because PCsat has cross polarized antennas and
you will always see at least one, but since we finally took some time
yesterday to measure it, I thought I would pass it along...

We bumped the telemetry rate on both the A and B sides up to once every 10
seconds (instead of once a minute) and captured as many packets as we
could with 4 receivers, one each 12 and 9600 baud on 145.825 and one each
```

on 144.39. Then spent hours making sense out of it all...

We *think* it had a period of about 4 minutes back in the first week of
launch (11 Oct) so it has either speeded up, or the students analysis
back then was in error...

There is no RX audio on the mic jack. The place to interface a TNC is the
6-pin mini-din jack which does include RX audio, TX audio and PTT (referred
to by the Japanese as "standby"). Note that the audio connections on this
jack follow the band selected for transmit ; i.e. if you expect to monitor
with the external TNC on band A and hit the front panel button for band B,
the TNC is also now listening and transmitting on band B. This is the
opposite of the built-in TNC that is assigned and FIXED to band A or B in the
setup menus.

What's the carrot?

The end user is going to determine how much the "APRS Certificate" is really going to be an incentive for a programmer. He or she will make the choice which software is going to run on his or her computer. A "APRS Certified" $60 program or a non certified free (or perhaps simply cheaper) program? Especially when money has to be paid to get certified as it is specified in the current WG charter this may become an issue. Then of course there's the trademark issue, and the question if the programmer even would want to carry the trademark of someone else.

Besides, the above is only true for programmers who are actually interested in their product to be somehow "popular" or for some other reason would like to see a some sort of a installed base. Those who are not couldn't care less about the certificate.

I was once a proponent of certification if it would result in the availability of a consistent and constantly updated design model. But I haven't heard from a WG lately and I assume it's non-existent. Well, they may not be formally dismantled and even might have members added to it, but for now it seems more like they only exist on paper.

One might also wonder how long the WG is going to be interested in doing this. What is the guarantee for the continuation of the certification program? If the program would be put in place today, but would die six months from now due to lack of interest (by the WG) or time or whatever other excuse can be thought of, then you have a bunch of applications that carry the "APRS Certificate" and a bunch that don't and never will since no-one is interested in executing the certification program anymore. Future applications will never even get a chance to get the certificate.

I don't think the current WG is really interested in the certification program or else we would have seen something happening by now.

73s,

Alex wrote:

> What's the carrot?

A marketing advantage in that the user is getting a product that is not seriously broken and/or that is maintained to remain compliant. This is a carrot for the developers.

The stick is peer pressure in the sense a user is using a APRS certified program or that a sysop/user maintains there software in the current compliant release. If not, it makes it clear the user has chosen to use a noncompliance program.

> A "APRS Certified" $60 program or a non certified free (or perhaps simply

Well, good point, but one would think the WG would consider waiving or reducing this fee, in particular in the light it would be to fix a clearly identified problem.

> Besides, the above is only true for programmers who are actually
> interested in their product to be somehow "popular" or for some other
> reason would like to see a some sort of a installed base. Those who are
> not couldn't care less about the certificate.

That is true and the lack of certification would not stop them in any way. Yet ham radio by and large is a social hobby, and most certainly is in the context of a APRS network. I think you are underestimating the power of peer pressure, when a easily identifiable problem can be identified in a clear and decisive way.

> I was once a proponent of certification if it would result in the
> availability of a consistent and constantly updated design model. But I
> haven't heard from a WG lately and I assume it's non-existent. Well,
> they may not be formally dismantled and even might have members added to
> it, but for now it seems more like they only exist on paper.

Two different issues Alex and I am not going to get into if they do or do not exist. I was told at the 2001 DCC that they did exist. I looked at their bylaws and it states that compliant programs will be awarded the logo "APRS certified". I'm simply stating that the application of this promise might be a means to reduce the number of non compliant programs and that it would be both a carrot (in the sense "APRS certified" would.

> One might also wonder how long the WG is going to be interested in doing
> this. What is the guarantee for the continuation of the certification
> program?

Are you asking me a question? I have no idea because I am not a member of this group. Yet I can say with relative confidence that something is better then nothing. The chances of continuation are mich higher if a program actually exists then if it was never followed through with.

> I don't think the current WG is really interested in the certification
> program or else we would have seen something happening by now.

That very well may be true, I have no idea and my suggestion was just one way you might fix the problem. Do you have any suggestions? Again, the contention is that END USERS/SYSOPS are doing nasty things with their software that affect the network. This was the specific charge that I was replying to:

>> Unfortunately, some IGATEs, Hubs and Servers respond with overly long
>> messages which often violate the spec. Some sysops seem to delight in
>> constructing these huge SPAM messages.

I've been in packet radio long enough to know if they can do it, they will. And yes, you can educate these sysops, yet in 3 months yet another group will come along. Running a packet bbs, aprs node or any number of things in ham radio can be an ego trip. Or the sysop may simply be ignorant to the operating standards. Yet their disrespect for operating practices can damage the network. Do we agree on that?

The key here is to assume whatever the user can do to damage the network, they will do. Hence, it falls upon the authors to write software that is not dangerous to the network if abused. A certification would encourage authors to be responsible in my opinion.

I was just suggesting if the WG still existed, once solution might be to actually do what they said they were going to do three years ago. I'm sure you can find a million ways to poke holes in my argument yet we hear the same tired arguments for anarchy in APRS time and time again. And ultimately, nothing gets done.

Regards,

Jeff

> You have my curiosity as to why an external tnc2 is going to be
> used!...

A good question.  But there is a niche where it is useful:

I finally got around to it so that now, with my KPC-9612 hooked up
as an external TNC and my D700 connected to my satellite antenna, I can
watch three of the data streams coming down from PCsat at the same time:

 1200 baud 145.825  most users
 9600 baud 145.825  some telemmetry (or Moblies but it is turned off now)
 9600 baud 144.39 where the GPS data is coming down now...

The external KPC-9612 does the first two simultaneously and the internal
TNC does the last one and can be either 1200 or 9600 but not at the same
time...

So much data flying around here!

490. [aprssig] APRN and HRU2002

From: John <kb2scs@optonline.net>
Date: Thu, 17 Jan 2002 18:19:14 -0500
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-57765-2002.01.17-17.52.09--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

```
Hi All

        On Sunday January 20 HRU2002 will be occurring.
We will have a live APRN Web page at the following URL.

http://www.hudson.arrl.org/nli/

The pictures you will see will of course be those taken
at HRU2002.
This APRN Web Page will be active on January 20. If
you go to the NLI web page now you will not see the
Link to the APRN page. On the 20th the link will be there.

So what is HRU2002. HRU2002 stands for Ham Radio University
20002.
It is a full day of forums about Amateur Radio.
It is located in Babylon Long Island.
Those that are interested please go to the above URL and
read all about HRU2002.

On Sunday go to the above URL to see Live APRN in action.
```

Let us hope we never witness the "Silence Of The Hams"

>> people not to query for IGATEs.
>>
> > N7AAC
>
>{snip} the query comes from RF and is returned RF. The APRS IS feed
\>can't filter such a task, its not smart enough.

Why not? Gateways should be able to do this. That is we call it a
GATEWAY and not a FAUCET.

\>Besides, an RF station requesting the query isn't heard by just a
\>single Igate. Count the responses and duplications of the echo's.
\>Could be from Igates hundreds of miles away running paths of WIDE5-5.

That's fine. That is exactly the info the mobile needs. Which I-gates
is he reaching?

\>Until a regional Igate concept is agreed upon, it won't happen. Are
\>you willing to adjust your path to reach the nearest Igate and no
\>others? I think we all understand the problem.

This does not require a meeting of the minds of those who see
themselves as in the ivory tower. This just needs some common sense.
If you are a software author, fix it.

>I'm not much of a 'king of the Mountain' person. Years ago when I
\>introduced my 'cell theory' to the guru's in Phoenix. Most of them
\>were totally against having an Igate, period. They wanted APRS to be
\>RF only.

This doesn't have anything to do with cell theories or with the
pioneers who saw tactical advantages of using APRS in Red Cross
Emergency Services, search & rescue, bicycle races, and mobile
recreation. This has to do with faulty software and what has to be
done to "fix" it.

>{snip}
>
\>Even if I developed a plan to do what you want, I'm afraid Phoenix
\>would be the last place for it to work. Sorry.
>
\>Dick Stanich, KB7ZVA

I don't see why it takes for YOU to make a plan. All we need is for
the I-gate software to work properly.

I am one of those that sees APRS as being RF. The TCP/IP backbone is
a wonderful addition to the APRS system and gives interested non hams
a window into our fascinating activities, but the origins and most
useful purposes of APRS are with mobile stations who communicate via

RF through digipeaters on earth and in space. The TCP/IP gateways should only be the connection mechanism that creates a seamless communication system world wide.

Let's don't let the tcp/ip tail wag the APRS dog.

N7AAC

492. [aprssig] Messages via PCsat to Travelers

From: Bob Bruninga <bruninga@usna.edu>
Date: Thu, 17 Jan 2002 19:21:16 -0500 (EST)
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-57776-2002.01.17-18.51.15--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Another PCsat first:

An RF message somewhere on the planet sent on an APRS channel and delivered via the internet to somewhere else on the planet where it was gated via PCsat to the end user. This is one more of the underutilized features of PCSAT as integrated into the worldwide APRS system. Here was the original packet within range of DIGI-1.......

```
  W2KQ>APW251,DIGI-1*/1::WB4APR   :good show bob  73 Joe{003
```

That message was picked up by an Igate within range of DIGI-1 (Like all APRS messages worldwide on any frequency) and sent to the internet to all other IGates worldwide within seconds. One of those IGates was AHUB-4 which has a port on PCSAT's channel. It in turn had seen WB4APR last via PCsat. So like all Igates, it pulled the live packet off the internet and sent if up via PCsat where it was digipeated back to WB4APR in Maryland LIVE:

```
  AHUB-4>APW251,PCSAT-1*/1:}W2KQ>APRS,TCPIP,AHUB-4*::WB4APR   :good show
                           bob  73 Joe{003
```

This was an unplanned serendipitous packet, but since it demosntrated where we are going with this, I thought I would share it. Now for the preverbial details:

1) In this case, the original packet was via PCSAT-1 (DIGI-1) but then went back into the internet to come back out via another IGate (AHUB-4) and then back up to the satellite. But if anyone anywhere on the planet had transmitted a packet to me during that 10 minute pass on their local RF APRS network, it also would have been gated just as well.

2) This capability can IMPLODE the PCsat system unless we get everything set up properly. Here is the problem... By default, any IGate assumes anyone it hears on RF is a local station (so Igates listening to PCsat will rightfully assume then that they have an RF path to that person (they do, but only for 5 minutes or so)... But we cannot let ALL igates then try to all transmit at once to send an internet packet back to someone via PCsat..

Possible solutions:

1) Only one Satgate per footprint. One on East coast and one on west coast. (but they will still collide enough to make this painful)

2) Travelers REGISTER with the SATGATE nearest where they will be traveling. No other packets are gated to PCsat. Thus, only one IGate will be watching for their traffic.

3) If there is only one satgate on your continent, then there is no problem, but since ANY copy of APRS running on anyone's home station can be an IGate transparently, you see that we can have a BIG problem.

Problem is, I dont even konw who the SATGATES are other than a few.. and they come and go. But managing this worldwide amateur radio LIVE messaging via satellites linked to the internet will need some committment and planning.

But this was part of the PCsat design, and remember that we can deliver these messages to MOBILES driving though Mississippi who dont even know there is a satellite, because these messages can come down on 144.39 anywhere in the USA.

But that is why all along, PCsat operations assume that travelers with the need to use the higher level features of PCsat will need to file a travel plan so that the network can be managed.

There are other un-used features of PCsat for remote travelers, but so far no such travelers (who will be out of range of the worldwide APRS system) have applied other than VE3RRY who will be on a cruise ship in the Carribean the week of 27 Jan.

  So do we <G>. That's the SM2496 you're thinking of
(http://www.shinemicro.com), I'm lead programmer on the project (or was?
We're not sure yet). Handspring has delt the Visor and Springboard markets a
fatal blow, but I suspect that there will be Visors available for a while to
come.

  The big question that we have is if we were to produce a limited number of
modem only springboard modules do you think there would be enough interest?
These wouldn't have MMC storage and wouldn't be able to play or record MP3s
but they would easily do 1200bps packet or any other protocol you want to
come up with.

I'd ask a different question - would it be possible to redirect your hardware efforts towards the Compact Flash form factor, which would make it available to a wider variety of hand-held devices, and, through the use of inexpensive CF->PCCard adapters, most laptops?

=====

Anybody who followed that link may have discovered that I was in the thick of the discussion.

I was trying not to say anything here until the information was better sorted out. I am still working on the code within pocketAPRS to support the DSP-based TNC Springboard, and have been on the phone in the past couple of days with the owner of the affected company trying to get a sense of direction. Needless to say, he's pretty down on Handspring - and Palm OS in general - at the moment. Frankly, so am I.

What we need is a better time line on this "announcement". There's been some hedging in the background about the meaning of "eventually discontinue". For instance, I know that I will "eventually discontinue" living, but not for a long, long time... (I hope ;-)).

As it stands today, though, I guess before I do much more work on this TNC support code I am going to need more information. Two things, specifically:

1) Get input from pocketAPRS users who are (or at least were) interested in this Springboard TNC (SM2496, http://www.shinemicro.com). It solves a problem, and very elegantly. Price of admission is $200 - not exactly cheap, but certainly less expensive than an equivalent 1200/9600 TNC from K-know-who.

2) Talk to my contact a little more about his plans. I know there were 100 beta units made, but I also know that a goodly number of them went to selected large clients, and that there were minor QC problems in some of the initial batch of beta boards (after all, finding problems is what "beta" programs are for!). So how many of the original 100 remain is an unknown.

Bottom line is that if he's not going ahead with any production run (which was the case as of Thursday a.m.) and there are so few (or no) beta boards remaining that we can buy, then it's pointless to finish the support programming. I personally like the concept, but I'm not going to bang my head against some pretty bulky code if I'm the only one ever likely to have the opportunity to use it.

I'll post any relevant updates either here or at the website, http://www.pocketaprs.com .

...mike

Is it possible that it made it out there both ways (Sat & Internet)?

Darell,

I checked the cable and it says it is a hot-sync cable. If I am not mistaken, a regular serial cable is different from a hot-sync cable.

Have you actually used this cable to hook up a GPS to the Visor??

Thank you for any info.

Comments below...

> Why not look into the Radio Shack WX200/Oregon Scientific WM-918? For
> about the same cost as the Dallas Semi 1-wire you get a heckuva lot

> better value in my opinion. More sensors are standard, nice indoor display unit, out-of-the box PC connectivity, much wider range of supported APRS platforms. Okay, so there are a few extra wires to contend with, big deal, what's another 3-4 wires up to the roof when most hams already have dozens! You can still find these on eBay new-in-box with the PC software and cable for about $175. No significant difference in the quality of the sensors (unless you end up with a finicky temp unit which is a known bug). That's the cost of the basic Dallas unit and I don't think it includes rain bucket or software.

I can think of at least three reasons to choose MicroWeather over the WX200/WM-918.

1) Equipment cost

MicroWeather ~$125
1-wire anemometer $107 (delivered)

Total cost for the MicroWeather-based station $232

WX200/WM918 $175+
APRS Client software $50+
PC $300+
Operating system $100+
TNC $50+

Total cost for the WX200/WM918-based system $675+ If you can use Linux, this cost goes down by $150 or so.

2) Power required

Microweather draws about 15 mA during operation. Assuming a 12V supply and reasonable efficiency of the P/S of 50%, as well as $0.10 per kwh for power, the power cost is:

24 hrs/day * 365 days * 15mA * 12V * 2 * $0.10/kwh = $negligible

if you choose the proper radio, this station can even be solar-powered - very important in remote-deployment scenarios.

In the WX200/WM918 system, the dominant power consumer (ignoring radio requirements for the two systems because they are equal) is the PC itself. Assuming the PC will dissipate 200W, the power cost is:

24 hrs/day * 365 days * 200 W * $0.10/kwh = $16.80

This is an annual cost. If the system is designed for 5 years of service, that's another $80 added to the price differential.

3) Reliability

MicroWeather has been designed to run unattended for remote deployment. One of my development stations has run unattended for over 3 months at a time.

Imagine trying to get a windows PC to run for more than a week without requiring a reboot. Especially in an "RF-rich" environment ;-)

As I've shown here, the cost differential between MicroWeather and the WX200/WM918 system, including 5 years of power, is a bit more than $520. This cost differential is reduced somewhat if you use a free operating system and APRS client. But the fact remains that MicroWeather is by far the lower-cost weather station implementation when comparing the two.

I think what we really need is modem cable which is different from the
hotsync cable. For the Deluxe and Neo the one markspace has won't work but
they are supposed to have one by Feb. I don't think the hotsync/DB9 cable
will work for modem use even with null modem adapter.

How's this for 'peer presure' self policing stick and carrot action...

An addition to the RF spec. Use one of the "many" bits to either indicate a packet origionated from a "certified" source or not. Then GATES, servers, etc will be enabled to either pass or drop "non certified" sources.

Pardon my cynicism, but what's to prevent the author of a non-certified
source from turning on the "certified" flag?

I'll speak up!  I have one of the beta units.  My intention is to
tweak the text-only open-source APRS program SmartPalm so that it can
handle these Springboard TNC's.  Whether a production run is made or
not, as long as I can eventually buy a module I'll work on the
software anyway.  If SmartPalm turns out not to be a good fit, I'll
write something else that's open-source and probably still text-only.
I have GPL'ed Xastir code to borrow from if necessary in order to get
a faster start.

I'd very much like to see pocketAPRS have the capability to handle
this TNC also.  I haven't registered pocketAPRS yet but if I can
someday reduce the RF noise generated by my PicoPacket, or if support
for the ShineMicro TNC is added, I will register.  As it is now I
can't really use the PicoPacket due to the noise swamping out my
handheld.  Have to get the ferrite kit out again...

Having this board available with pocketAPRS, I would certainly
register pocketAPRS and get one of these Springboard modules.

Even more so because European maps are finally becoming available from
Henk  PE1DNN (thanks).

Not yet, but we're considering hooking into these with Xastir. It
currently supports USGS topo maps in geoTIFF format, chops off the

white map collar and tiles them together in a fairly seamless
fashion. This gives you free maps with a free APRS program, not a
bad combination! If anyone really believes you have to pay money for
good programs, contact me off-list and I'll try to help you with that
little problem too. ;-)

<SHAMELESS PLUG MODE>

The latest CVS version of Xastir runs on Linux/FreeBSD/Solaris/
Mac OS X. See http://www.xastir.org for details. We're nearing the
end of another release cycle, so look for Xastir 1.1.0 soon. Until
then, 1.0.6 from CVS is the most bug-free. Upgrade to 1.0.6 if
you're using older versions, you'll be much happier.

I think we can claim to be the APRS program that costs the least
($0), runs on the most types of operating systems/hardware, and
handles the most map formats. I've seen it run on PowerPC, x86,
and Sparc hardware so far. It handles something like 114 map formats
at last count!

</SHAMELESS PLUG MODE>

If you can stomach the usually out-of-date USGS maps, or update the
images yourself, then Xastir might work well for you. USGS geoTIFF
maps are TIFF images with extra tags added, so you'd need to edit
them in a geoTIFF-aware editor. Most normal image editing programs
strip the geoTIFF tags right out. There are also methods of saving,
then re-introducing the tags later if you're interested in trying
this. If so, contact me off-list and I'll try to help.

I'm in SAR, one of the Xastir developers, and planning to add
SAR-specific features in the near future. Exactly which features to
add is up for debate, but I have several already on my TODO list.

In our county SAR is a volunteer organization, so we have the usual
problems of little or no funding for hardware/software. We need the
most accurate maps we can get our hands on though, so it's a real
problem trying to balance the two.

If the TOPO! maps would be of use to Xastir users, I'd like to hear
about it. Support doesn't look that difficult to add. We can
already support darn-near any image format you can shake a stick at.
The old version of TOPO! I've seen uses GIF files but I've heard the
newer versions use JPG. We already have support for both in Xastir,
so it'd be a simple matter of figuring out which files to load/their
positioning on the screen. It's very similar to what we already do
with USGS Topo maps.

Comments are most welcome.

Curt

Any chance XASTIR works with the NIMA/DMA ADRG or CADRG (Arc Digital Raster
Graphic and Compressed Arc Digital Raster Graphic) CDROMS ??? That's what
DoD puts out and that would be useful too !!!! The specs are available on
the internet...

Ken

I could not make the link work.   Either it's down, a problem on my end,
or you had some kind of a typo in the address.

The New Mexico SAR Support Team is using the 'All Topo Maps' produced by
Igage for our topographic work in APRS.   We run APRS+ and display maps
on the Delorme Street Atlas for our 4WD and other vehicles. We use the
server in APRS+ to feed the data to All Topo Maps for foot teams in the
mountains. The programs run simultaneously and data can be viewed on

either map set depending on what kind of display we need.

The current All Topo Maps come in an 8 CD and are sold by state. They
are extremely high quality and produce impressive maps.

Looking at igate.com, I see that they have NMEA input, but didn't see
anything about linking to APRS feeds. Can you show multiple objects
at once on the topo maps, and can it handle MIC-E format and other
APRS formats, or must it only accept NMEA or simulated NMEA for one
object?

How much memory is needed to run such a three-program setup?

To avoid confusion be sure *which* program you are talking about. There is
TOPO USA, and then there is TOPO! They are by two different companies, but
I've seen folks refere to TOPO USA as just TOPO and *that* is easily
confused with TOPO! (note the exclamation point)

TOPO! is now sold by National Geographic, while TOPO USA is, I think, a
DeLorme product.

Hey all.
Just rejoined the list today so I may have missed any
info on this question. Sorry about that.

Anyway, does Precision Maps v4 work with winaprs?

I used to use 3 and wanted to know befor I went and
ordered v 4.

Thanks

Harold

Harold,
  The current WinAprs versions do not work with PM 4.0.

I have been informed that PM 5.0 may be just around the corner. Will believe it when I see it.

Haven't tried!

I had to customize a lot of the code to attempt to get the USGS DRG's
into a somewhat rectangular format and to crop off the map collar.
Try loading another DRG format and it'll try to do the same
conversions for display.

Do you have some (three adjoining maps, up/down/left) you could send
me, if they're not too many megs?

I'll assume since they're from a government agency that they're
public domain data, just like the USGS DRG's...

A bit ambiguous:  I meant I'd be happy to relieve you of some of that
excess weight in your wallet.  I did _not_ mean that I'd send you any
programs that cost money or were copyrighted.

I'm a big believer in open-source, and make a fair attempt at
avoiding operating systems or programs that cost money or are
proprietary/closed-source.

Open-source programs can be freely shared, including the source code.
In fact, the copyright/license requires it!

:-)

521. [aprssig] PCsat Status

From: Bob Bruninga <bruninga@usna.edu>
Date: Fri, 18 Jan 2002 21:33:06 -0500 (EST)
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-57939-2002.01.18-21.04.31--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

PCsat Status:

GPS science testing on PCsat finished today. We will turn it back on at 1000z for 2 more days (Sat/Sun) for your tracking enjoyment. In the USA, watch for PCSAT-11 on your 144.39 mobile. And PCSAT-1 on 145.825.
In the USA, you will get 3 passes from about noon to sundown...
(the other 3 are before SunUp).

For what it is worth, here is some data from a pre-dawn pass yesterday (when no one was awake, probably unattended). THe time increments are 1 minute through the pass (Half pass because my beam was pointed North).

```
STN-1  . . . * * * * . .
STN-2  * . . * * * . . *
STN-3  * * . * . * . . .
STN-4  . . . . . . * * .
STN-5  . . . * . . . . .
STN-6  . . . . . . * . .
STN-7  . . . * * . * . .
STN-4  * . . * * * * * . (second pass)
F9TL   2 packets from France
N3IYI  1 packet from a train
```

Those that were sending at a 1 minute rate (twice the routine rate) did just fine and you can see that they would still have been successful at the recommended 2 minute rate... I know that N3IYI uses a 5 minute period from his train cars to a 19" whip on the roof. Not sure of the F9, but since it was good DX, I included it...

Remember, if you are mobile, portable, or especially if you are traveling or doing anything interesting we welcome you on PCsat!

Well, the talk around the office is that it probably was an unfortunate comment by Dubinsky that was taken out of context, and Handspring isn't doing anything rash yet.

I mean, Treo isn't going anywhere here soon. We're all doing CDMA, and as I recall, it is GSM like the Visorphone. Except for VoiceStream, we havn't got GSM anywhere in Indiana.

To get back on-topic. I hope people keep developing springboards for it.
I'm dying for the TNC springboard.

73,

Tom WB8WOR

You're an optimist. Look at Handspring's own statements - they are doing
something rash. And they have a huge disclaimer on their web site about
it. This was not an unfortunate, out of context statement.   It was a
carefully worded prepared statement in a press conference.

Final quarter of 2001, although profits were up for Handspring, their net
loss is something like $20 million.   Current stock price is hovering at
about $6 per share. Roberston Stephens has it listed as a buy, but I think
that has to do with the stock price being low, and not to do with anything
long term. We also know that market analysts can be bought and are more
often wrong than right.

>I mean, Treo isn't going anywhere here soon. We're all doing CDMA, and as I

Exactly why the roll-out will be in Europe.

>To get back on-topic. I hope people keep developing springboards for it.
>I'm dying for the TNC springboard.

I wish I could share your sentiments. Handspring is not well capitalized
enough to support both the Treo and the Visor. Visor sales have been flat
(9 percent increase at Christmas and only with price cuts, rebates, and
give-aways) and something needs to be axed.

An honest Treo review:

A bit more information is available at
http://radio-active.net.au/consult/projects/rezn8/scooter.html

I was wondering if anyone would pick up on it. The article is from the DCC last year... I might present it this year unless someone blows up the Sydney Opera House or something leaving me unable to get to the USA. What neither of these show is the scooters I built in front of the companies trophy cabinet with 9 Emmy Awards, and an Acadamy Award (TM). What is more interesting is that Bill Kovacs who co-wrote the paper actually has an Acadamy Award, which he got for starting Wavefront, one of the big names in the computer graphics business, and purchaser of SGI's first computer.

Darryl

P.S.

While I am at it here is some information on APRS in the Sydney Olympics - including an article.

>
> How much memory is needed to run such a three-program setup?

All incoming APRS data is processed by APRS+ so Mic-E is an acceptable input. The connection between APRS+ and All Topo Maps (ATM) is via a program written by Steve Coffin and is done using the APRS+ TCPIP connection and links directly into the ATM executable. It is not a serial port interface. Steve's program has several 'switches' which allow you to specify the specific stations you want to plot on the ATM maps, or to specify that only stations within a certain range of a selected fixed point be plotted. NWS data is not processed onto the maps nor are status reports but since the two programs are running at the same time, that is more easily done with the APRS+ displays.

The APRS data is then manipulated in ATM via the normal waypoint file editor that is part of ATM to make the line widths or other annotations on the maps. At this time 'Tactical names' are not displayable on the ATM maps.

I don't know how much memory it takes to run all three programs but the

ATM map files are extrememly large, some 80 - 100 Meg picture files, but
well handled by routines Mark Silver has developed for ATM. For awhile
we ran it on our NMSARS Team computer, an old Winbook with 64Meg of
memory, and Mark's program notes indicates it can be run on a 60 MHz 486
w/ 8 megs of memory. (I'm not sure if this isn't a case of Mark's subtle
wit re the efficiency of his program routines) but the bottom line is I
can't tell any problems with running all three programs on my normal
computers.

The work by Brent on APRS+ and Steve and Mark on ATM has given our SAR
team a fantastic capability to plot our resources both on Delorme Street
Atlas maps and on All Topo Maps. Two GREAT products!!

That's pretty much the same response I have received from Handspring. There
are copies of several letters up at http://www.visorcentral.com, including
one released last evening from Jeff Hawkins.

It looks like the predictions of the Visor dissapearing were premature, but
not completely off track. It sounds to me like Handspring will stop creating
new Visor devices, limiting themselves to their current lines (which they are
consolidating -- no Prism in the near future). I was disappointed to see them
drop the Deluxe, which I think was a great deal at $149.

Personally (and just for the record, everything I write is my own opinion and
not that of Shine Micro, I'm just a software guy), I want to see the SM2496
come to market. I think it is the coolest product to hit the ham market in
previous years, with the ability to do a gazillion things that we haven't
even thought of yet. The integration of a programmable DSP and the GUI
interface of the Visor is perfect for all kinds of portable applications.

The big question is the one that you always have to ask -- can we sell enough
of them to make it worthwhile before Handspring cans the Visor completely.

but anyways, this discussion should probably be taken off list before we get
the moderators in a tizzy. I've got a web board setup at
http://www.shinemicro.com/forums for any discussions that people want to
conduct.

Got this Email today from PE5YES via PCsat.  Here is how it works:

1) He sends normal APRS message from his rig via PCsat while in view.
2) PCsat digipeats it
3) It was picked up by a SATGATE (DF5FF-10) and injected into APRS
Internet
4) THe WU2Z APRS "Email Igate" in New Jersey which monitors the worldwide
APRS stream 24/7 saw it and pulled it off the stream, wrapped it up as
email and sent it to me.

What's the possibility of having Steve's middleware work with Delorme's
TopoUSA 3.0?  TUSA 3.0 can actually read (import) the overlays for Street
Atlas,  and can handle multiple draw layers simultaneously.
     TopoUSA has the same road database as Street Atlas but the relief data
is a repackaged version of the USGS DEMs.  It's GPS track feature is MUCH
nicer than SA's -- it doesn't use those fat chunky green arrows that cover up
adjacent detail.  The current position is large and flashes; previous track
points are smaller (about the size of the road lines) AND DONT GET LOST when
the map is zoomed or scrolled.  The ENTIRE GPS track remains indefinitely
until cleared (or the program is shut down).  You can plot/show an entire
day's driving if you wish, not just the last few minutes like SA.   [ These
comments refer to Delorme TopoUSA Ver 3.0 which is VASTLY improved over the
two earlier versions. ]

BTW,  I discovered you can use APRSplus and run SA's native green arrow GPS
tracking at the same time.    Feed the GPS data stream directly into Street
Atlas though  a serial port other than ones being used by APRSplus, and start
SA's own GPS track routines.  You will see the native SA green arrows, and
Brent's data from APRSplus at the same time.
        [ In my configuration, APRSplus is taking in the Kenwood D700 mixed
TNC/GPS data stream through port 1 set to to the special  "Mode7" . SA is
taking in the same raw GPS data  (that is going TO the D700's GPS jack)
through a serial-to-USB converter.  Sometimes I "cheat" and plug an entire
second GPS unit with a native USB interface (Holux GM-200U) into the USB port
where it shows up as a virtual COM5 device which SA has no trouble accessing.
]

An alternative is to let APRSplus drive Street Atlas in the normal way,  and
then run TopoUSA 3.0 simultaneously with IT'S native GPS driver (actually
nearly identical to SA's) using the second GPS feed for a completely
non-APRS-related display of my own position

I run all this PLUS WinPix32 (sound card SSTV program) simultaneously on a
Dell Inspiron 3000 laptop (classic Pentium MMX 233) with 224MB RAM and
Win98SE.

Rendered body type: text/plain

I just updated my DOS telemetry program for PCsat and posted it on:

ftp://tapr.org/aprssig/dosstuff/APRSdos/pcsat000.zip

I added satelltie tracking to it, so you can see when the satellites will
be in view and so you can run just this one program for predictions,
telemetry display and communicating via PCsat. It does not do maps.

For normal PCsat ops, you are probablly better off running your normal
APRS program or my APRStk, but this one is tailored to PCsat telemetry.

See the PCSAT.TXT with it..

Mike Gray KD7LMO has been building the micro beacon for APRS and the
ATV system that we use in our Arizona Near Space Research balloon
flights. I believe that he is in the process of building an ATV

equipped R/C airplane. Perhaps he can answer your questions.

Joe

I think you live in or around Annapolis MD. You might want to give Vic Curtis, WA3YUV, a call on the 147.15 repeater in Brandywine. He's been "playing" with ATV and R/C airplanes for a while now and gave the local radio club a talk about it last spring including samples of his work.

Check with MFJ for a small 70 cm
ATV transmitter that runs on a 9 VDC
battery.

If audio a must, then check with PC Electronics.

PCSAT	144.39		7	P 1200 bd UI DIGI	ON over North America
SAPP	437.095	TBD	4	P 1200 baud packet	Downlinking only Posit for now
OPAL	437.100	437.100	1	P 9600 bd UI DIGI	ON but hard to hit and hear

The S column is a relative signal strength subjective receive assessment based on using a 1/4 wave 20" whip on the roof of your car. This antenna is about the best for satellite mobile unless you want to carry a beam.

USING A 20" WHIP VERTICAL WHIP ON YOUR ROOF:
As a rough approximation consider this table which I have subjectively determined after 3 months of daily monitoring. Home stations with 50' of RG 8 should subtract abt 3 from the signals and 5/8 or dual band, or "gain" antennas should also subtract about 2.

There are lots of satelltes lots of times throughout the day. If you are stuck in your car, enjoy them!

SIG	RECEIVE RANGE
9	Horizon to Horizon
8	5 deg and above
7	10 deg and above
6	15 deg and above
5	20 deg and above
4	25 deg and above
3	30 deg and above
2	3 ele beam
1	6 ele beam required

MOBILE TRACKING DATA:
The AZ and frequencies of satellites in view are transmitted to mobiles once a minute on the local APRS 144.39 frequency if there is a local APRSDATA server in your area. Also a satellite schedule for the next 80 minutes is transmitted once every 10 minutes. If you have the Kenwood D7 or D700 integrated APRS radio, this information will be flashed on your front panel or spoken to you so you can't miss it... See SAT-INFO web page below:

Another AVRS (APRS<==>IRLP) idea:

On our AVRS node, we want to have a second PTT output connected to a 144.39 XMTR with "VOICE-ALERT" PL100. THus the IRLP software will pull this PTT low whenever it makes an incoming call announcement.

Then those of us driving around with "APRS Voice Alert" (a radio monitoring 144.39 muted with CTCSS 100), will have a free alert system for letting us know when someone in the world is calling us and we can QSY to the unused IRLP frequency to recive our call.

Since I do not know all the voice announcements available on an IRLP node, I assume there is a subset that would be suitable for "Voice Alerts" and those that are not. (We want to minimize any QRM on 144.39 except for the most essential). There should be a bit with each announcement which indicates if it should include the AVRS PTT or not.

ALso, this IRLP software should have a second CARRIER DETECT input from the 144.39 Xcvr as well so that it will not make the annuocement until the data channel clears...

This idea is by no means a receommended application in other areas. But in those areas where it is useful, it can be a very good option. Eventually, I would expect to have a dedicated LOCAL AVRS (APRS/IRLP) channel that will provide the APRS "Voice Alert" mobiles with all the APRS connectivity and IRLP stuff on one local channel (AVRS) so that we get out just one radio band. But until we reach that state of AVRS maturity, this dual PTT conecpt integrated with existing "Voice Alert" can be a good local option in the transition phase...

Rendered body type: text/plain

Some stations are doing a great job of taking the PCsat-1 bulletins, translating them into other languages and re-transmitting them on APRS in their country. I think this is a great service!

But due to the global nature of the APRS network, our Telemetry logging program also sees them here as well. Thus our telemetry logs are filling up with multiple copies of packets which were not actually generated by PCSAT-1 iteself. If I could suggest that it would help us if you used the generic callsign of PCSAT instead of the -1 SSID, so our telemetry logging programs can tell the difference. Thanks.

Its hard to get used to the fact that a local APRS packet anywhere, generally goes global everywhere...

Thanks. And thanks for your initiative in providing a useful service to those in your country. Someone on each continent might also consider putting up an APRStk Satellite server that will transmit satellite position pcakets via each digipeating satellite (ISS, PCsat, Sapphire, Opal and UO-22). So that mobiles can see on their radio front panel or mobile APRS system where the satellite is.

Contact me for details or see the satinfo web page.

For the last year, we have had one APRStk station on the East and West coasts of the USA providing this service to all satellite mobiles in the USA...

Rendered body type: text/plain

I have recently purchased a second D7A(G) so I could install Bob's APRSTK ftp://ftp.tapr.org/aprssig/dosstuff/APRSdos/aprstk.zip tracking program and be able to provide a full time feed to the Internet of satellite.

I have built Bob's "PRACTICAL ROTATOR SYSTEM (APRS)®" http://web.usna.navy.mil/~bruninga/rotator.html purchased at Dayton this year, but been unable to install it yet first due to me being busy for a few weeks after 9/11 and secondly due to Iowa winter and my all metal roof that slopes at 25 degrees. Currently there is a Cushcraft V-42 VHF/UHF installed feeding the D7A(G).

What I have learned is that APRSTK has no built in interface to be able to feed the data I receive to the Internet. For my home 24/7 APRS station I am running APRS+SA. I asked Brent to consider making a enhancement to the APRS+SA to allow for a second radio input but he has declined (I'm not complaining). He did suggest that I try KipSS but I have been unable to figure out how to do what I want with it.

Other than having APRSTK digi the signal so my other antenna (20 ft away)

can receive it and feed the Internet, does anyone have any other solution
or have I missed anything stupidly obvious?

Dave

Rendered body type: text/plain

The latest version of AFilter is v2.6.9. Alogger is a very cool program to
log anything on APRS. Has built in icons and even a serial port hook up.

Hi Earl,

At nights here around Chicago this happens as the dew or moisture
content goes up and the radar has more to bounce rf back, could
that be the case there?

         Actually, it's really DRY here, and the wind is blowing pretty
hard.  I suspect it's the dust in the air.  visibility 4+ hours ago was
over 100 miles, it's now down to perhaps 10 or 20.

Dust has a very low radar cross-section.  Even snow is hard to see.
If the air is very dry and there is no cloud return the radar AGC will
open up and it could be ground clutter.

  On the other hand, I noticed Roswell to the south and west.  It could
be another government cover-up ;-)

> Delorme's TopoUSA 3.0?

No that won't work.  The small program Steve wrote is integrally linked
into the ATM executable and thus will not work with other programs.
When it runs, there is no screen or other display per se'.   You set a
series
of switches in a batch file to start it after you have APRS+ and
ATM running.  Then the data is moved via TCPIP from APRS+ into the
ATM program where an include statement in the ATM waypoint file allows
you to use the APRS+ tracking data.   Bottom line is the program is of
no value unless you are specifically using ATM and APRS+

You may have already discovered this but for others who might be interested in your application of APRS+ and Street Atlas running concurrently, I offer the following.

In APRS+, SETUP, PROGRAM, it is possible to 'reserve' an instance of SA. Thus you can have two copies of Street Atlas running. One taking in your GPS data and plotting your position and the other copy being driven by APRS+. The reserving on an instance of SA prevents the APRS+ maps from disturbing the first copy of Street Atlas which is plotting your position. Thus any zooming, changing maps, etc on either map do not affect the other map. There are a lot of instances where this is very handy.

Cannon AFB Radar was in clear air mode- scale changes to top reflectivity at only 28 dbz - in precipitation mode the top is 75 dbz. The radar will change to this mode after a period of no precipitation. Here in South Florida you can actually pick out the sea breeze line in clean air mode.

Rendered body type: text/plain

This afternoon someone on the local network set the Position Comment on their dumb (shouldn't it be "deaf"? HI) tracker to "Emergency!". The alarm went off on my D700A, but then about 30 seconds later the radio did a power-down.
At first I thought it might have been because I knocked a connection loose when I hit the "Detail" button on the control head, but it happened every time I got the position packet with the "Emergency!" position comment. This happened about 5 or 6 times.
Anybody notice this behavior before? Is it a known bug?

Peace and 73,
Stephen
W3SMK

P.S. I hope the station sending this was not in any real trouble! I tried messaging him, but again, he was using a "deaf" tracker ...

So I've been told, but it isn't Cannon -- it's a little community called Field.

Thanks,
Earl

or have I missed anything stupidly obvious?

It's not stupid, but you can do something I've been doing for two years now. Make a Y in the serial data, to pass receive data *ONLY* coming from the D7/TNC and feed it to your I-gating computer in parallel, running something such as APRS+SA. SA will I-gate the heard packets, but will not be able to control the TNC, since the TNC can't hear anything from the second computer (you don't Y the transmit data line.) The first computer talks to and listens to the TNC (and in the case of APRStk and a D7, controls the radio modes and frequencies.)

The only thing you should verify is that your gating software only passes valid packets on to the Internet. This is because your second computer will also hear ASCII text that is the TNC responding to commands from the first computer (such as "unproto was NOCALL" when APRStk sets the new TOCALL for each satellite), not just valid received packets from the TNC.

73 and let me know if you have more questions,
Skip/K3FOR

K3FOR does it by just diode-ORing the RS-232 from his APRStk TNC (The D7)
with the output from his 144.39 TNC both into his IGate software...

There is potential for collision, but it is low.

If the APRS channel is at 20% (optimum for an ALOHA channel) and the
serial ports are both at 9600, then the serial port is actually busy less
than 3% of the time. And PCsat is only in view about 3% of the time but
only has data 10% of that, so the chance of collision with your normal
IGate feed is about 1% and the potential for collision with PCsat packets
are about 3%.

But it gets you started. I think WinAPRS may take two TNC's.
And Bill Diaz's AFILTER and/or ALOGGER supports a serial port input too..

But you are right, the best way is to find an APRS Igate software that
will take two TNC's (and will filter out all of the TNC commands from the
feed)...

When you combine two data sources (the output of two TNC's for example)
you must diode isolate them. Then put a 15k resistor across the diodes to
provide adequate pull down for it all to work fine...

Sometimes you may get lucky and it will work without the diodes, but I
would be amszed at that and it is one chance in dozens..

> or have I missed anything stupidly obvious?
>
> It's not stupid, but you can do something I've been doing for two years now. Make a Y in the serial data, to pass receive data *ONLY* coming from the D7/TNC and feed it to your I-gating computer in parallel, running something such as APRS+SA. SA will I-gate the heard packets, but will not be able to control the TNC, since the TNC can't hear anything from the second computer (you don't Y the transmit data line.) The first computer talks to and listens to the TNC (and in the case of APRStk and a D7, controls the radio modes and frequencies.)
>
> The only thing you should verify is that your gating software only passes valid packets on to the Internet. This is because your second computer will also hear ASCII text that is the TNC responding to commands from the first computer (such as "unproto was NOCALL" when APRStk sets the new TOCALL for each satellite), not just valid received packets from the TNC.

Interesting program, and I'd like to use it in WinAPRS. Anybody know where to get the .geo file? Or how to calculate what needs to be in it?

Thanks,

Earl

To: TAPR APRS Special Interest Group
Subject: [aprssig] D700A "Emergency!" Bug?

This afternoon someone on the local network set the Position Comment on
their dumb (shouldn't it be "deaf"? HI) tracker to "Emergency!". The alarm
went off on my D700A, but then about 30 seconds later the radio did a
power-down.
At first I thought it might have been because I knocked a connection loose
when I hit the "Detail" button on the control head, but it happened every
time I got the position packet with the "Emergency!" position comment. This
happened about 5 or 6 times.
Anybody notice this behavior before? Is it a known bug?

Peace and 73,
Stephen
W3SMK

P.S. I hope the station sending this was not in any real trouble! I tried
messaging him, but again, he was using a "deaf" tracker ...

Hi Henry, not sure if your are just trying to program freqs or use it for displaying data as in APRS use through a PC.

What we found out after much fustration, if you are going to use the D700 to read data like for win aprs. The D700 "must be in Packet" mode and not in the "APRS" to work properly. When using the D700 in conjuction with a PC have the D700 in the Packet mode.

We, as a SAR group, here in AZ where going nuts trying to get the D700 to interface with a notebook PC. Till someone pointed this out.

good luck
Douglas

>>> "Doug Henry" <dhenry@skyweb.ca> 01/15/02 09:52PM >>>
I'm looking for some tips to get the Kenwood MCP-D700 software to work with my new TM-D700. I'm using a DB-9 null modem cable between the radio and computer. I'm connected to Com1 with the following parameters:
Bits per Second: 9600 (I've tried the other transfer rate options too)
Data Bits: 8
Parity: None
Stop Bits: 1
Flow Control: Xon/Xoff (I've tried Hardware and None too)

The radio is setup as TNC APRS on Band A with VHF/UHF Ops on Band B. When I try to read data from the radio I get a window that says Reading Data from Radio but before anything happens it is replaced by a Communications Timeout Error message.

Tnx Doug

Hi Brad,
My apologies for the late reply, but I am now catching up on the SIG after being off for a few days. I have been operating an HF gateway from Trinidad for more than 2 years and that interference has been there from day 1, as far as I can remember. I have listened to it extensively and have found that there is more than one source of the noise. According to information available to me, it MAY be Over the Horizon Radar, which may be Russian in oigin. There is also another possibility and that is that it is commercial digital traffic of some kind. At times, it seems to me that it may be two stations talking to one another. Further to that, there is also a huge amount of interference from apparently illegal Voice comms on 10.050 USB. There is a large amount of traffic, apparently from South America on this frequency. Both of these sources cause me LOTS of interference on a daily basis and I believe that if we could shift downward a couple KC's we could eliminate much of the problem, but that's not my call. I hope this answers your question.

73's de Eric 9Z4CP.

10.050 through 10.100 are internationally allocated to (voice) Air Traffic Control; are you saying 'illegal' as in 'not ATC'?

Aother consideration when one sees a lot of "stuff" resembling exagerated ground clutter, or wierd spokes, etc., emanating from a radar site, is a phenomenon called 'anomolous propagation.' In this case, a change in the index of refraction for the RF at radar frequencies can result in a marked extension of range, without an apparent change, an increase in ground clutter, a change wherein the radar returns are foreshortened, etc. This is the same phenomenon that causes "ducting"

or band-opennings at VHF and UHF, but is more graphically represented on
a radar PPI (yes, Dale, I'm showing my age!).

I need the county maps that I had for winaprs a long time ago and can't seem
to find them. Can they be downloaded somewhere? If someone out there has the
files of the colorado county maps that are compatible with the aprs ce I
would like to hear from them.

Thanks for the information in advance.

Are you aware there are 3 sizes of "fat chumky green arrows" to choose from in SA?

This answers some of my questions about a MAYDAY mode for my airmobile TTII.
Did anyone call 911 or something and say there was an emergency at XX
address?
If you all assume the emergency symbol is an error unless the station backs
it up with some other info it is about useless. If I have my PK-12 in
stand-alone mode or my TTII then I have no way to know if I am receiving a
message or to answer it.

This is a really interesting question and point.

What exactly does the "Emergency" Message Code/position comment mean?

I searched the APRS spec and did not find an answer there ...

Perhaps someone can offer the "tribal memory" on this ...

Is there some protocol on this? I guess it depends on what this Code is
meant to be used for ...

If it is meant to be a distress call, it is one thing (which I would guess
it is not), but if it is meant to indicate the location of an Emergency it
is another...

This is the first time I encountered this code in use, and I was baffled as
to what I was supposed to do with this information. Beings the sending
station was a dumb tracker there was no way to know how to try to contact
him. Maybe this is a good application of Bob's PL 100 tone idea...

Also, I presume by the silence that no one has noticed a software bug with
how the D700 handles this message code.

Thanks!
Peace!
Stephen

What I hear in NM right now are two guys on 10152.77 LSB just chatting
about something in spanish. I do not speak spanish but this is not ATC
type of converstations. There is laughter from time to time and the
conversation goes on and on and on.

On this topic, I would certainly recommend moving frequency to be more
conventionally in the band. My radio will not transmit when I have the
dial set at 10151.5 LSB as it thinks it is out of band.

QSL Jeff,
There is normally lots of traffic, mostly in Spanish on this frequency.
While I do not speak Spanish, I do understand a bit and the conversations
are not ATC related. When I first started gating, I was getting
interference
and listened one morning. I heard someone speaking in English so I called
and they answered. He had no callsign, did not know what that was and said
he had been transmitting on the frequency for more than 5 years and no one
was going to move him. I also hear telephone tones from time to time and
it
appears that some one is patching on the frequency.

I hope this gives you a better idea of whats happening.

Best Regards,
Eric Mackie 9Z4CP.

Anyone had any experience with the Garmin Street Pilot III, as
applied to APRS? What are some initial impressions? I am thinking
of picking one of these units up for APRS work, and to support my
constant travelling.

I have seen comments where this unit at least does allow both NMEA in
and out, to allow Waypiont uploading from my TM-D700A, that is at
least some improvement over the past.

But, what is the deal with the DCA (Digital Coverage Area) and an
unlock code? Are you only allowed to unlock the City Navigator for
one area? How expensive is it to unlock for everywhere?

Regards,
Bryan (NA4AL)

As he asks, from the unenlightened position of ignorance... I found the details on the DCA and unlock codes. OUCH, rather expensive. There are 10 DCA areas in the US and Canada. You get one with the unit, and can purchase additional DCA's for about $90. Or, you can purchase rights to all ten for ~$190.

So, that answers that question, but still interested in the groups impressions on using this device.

I use the SPIII and like it alot. There are what they call "Base Maps" loaded for all areas, so even if you don't buy all the City Navigator areas you still have maps of the areas. It has the main roads such as interstates etc.

You will find though that the City Navigator maps may be better for big cites but it isn't much better than the base maps for most areas. It is more up to date for those areas, but I prefer the more detailed Mapsource, which is another versions of maps they offer. It is more detailed, for the rural areas. You also get the whole country and don't have to buy areas.

The 2-way NEMA is nice, as you can see APRS spots show up on the GPS.

Bob

Hi,

I recently downloaded v2.01 of APRS+ & registered it. I set it up with SA 9.0 & can see APRS traffic on 144.39 MHz when I tab to the "TNC" screen but on the position screen, I can only see my own station. I downloaded setup instructions from TAPR and "www.cqdxhamcoffeshop.net", but neither have any specifics about this. Can anyone tell me where my error is?

Bill Rausch, AA6PA

580. [aprssig] Cell Phone GPS 'Air Messages'

From: Matt Steinhoff <mls@steinhoff.net>
Date: Mon, 21 Jan 2002 12:30:23 -0500
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>

Message-ID: <LYR842-58263-2002.01.21-12.00.21--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

```
I have often considered putting 'speed trap' objects
into ARPS so that both locals and visitors (I am in Orlando
and there are many tourists) driving through town would
know when they are coming up on The Man<tm>.
    I could have objects for both normal enforcement
locations as well as dropping new points as I'm sitting
on the side of the road getting my ticket.
    It would be great it if, while on a road trip, I
could know where all the fuzz are along my path based on
the reports of people ahead of me with GPS and APRS. (CB
radio works great for this purpose now but I must admit
that a higher-tech solution would be very much sexxy.)
    Below  is an excerpt from a December New Scientist
article (pardon me if you've seen it before) that talks
about cell phones with GPS that can put messages 'in the
air'. Fairly interesting even if it is a disaster waiting
to happen.

    Matt (k4mls)

    "
    Pinning messages in mid-air, using the location's Global
Positioning System (GPS) reference, could become the next
craze in communications. The messages are not actually kept
in the air: they're stored on an Internet page. But that
page's Web address is linked to coordinates on the Earth's
surface, rather than a person or organisation. As you move
about, a GPS receiver in your mobile phone or PDA will check
to see if a message has been posted on the website for that
particular spot. If you're in luck a snippet of info-left as
text or a voice recording by someone who passed there
previously-will pop up on your screen or be whispered into
your earpiece.
    "

Jim K5QQ responded:
>The small program Steve wrote is integrally linked
>into the ATM executable and thus will not work with other programs.
>When it runs, there is no screen or other display per se'.   You set a
>series of switches in a batch file to start it after you have APRS+ and
>ATM running.  Then the data is moved via TCPIP from APRS+ into the
>ATM program where an include statement in the ATM waypoint file allows
>you to use the APRS+ tracking data.   Bottom line is the program is of
>no value unless you are specifically using ATM and APRS+

Also, WinAPRS can feed AllTopoMaps thru Steve's program.
So, ATM is used for topo detail while WinAPRS is used for everything else.
WinAPRS handles the serial port, and ATM uses an IP connection to WinAPRS.

AllTopoMaps uses 160dpi maps while the original USGS maps are 250dpi.
The maps are still usable at that resolution.  This product does not provide
seamless coverage like TOPO! (National Geographic, also ~160dpi),
TOPO USA and 3D TOPO QUADS (DeLorme), or Terrain Navigator (Maptech).
AllTopoMaps does have a separate program that creates a map file covering
a region that you specify, that may include areas from several original maps.

Xastir uses the original USGS DRG map files, and is the only program that we've
discussed that will display a map that you may have scanned, or created in an image
editor.  I have a couple of maps (so far) that combine portions of several USGS files.
I've removed extraneous stuff, often with laborious pixel editing, so it ain't necessarily
easy.  Then I add stuff, like GPS tracks of hiking trails (in RED !).  WinAPRS can
use these (not the best display), but you must "adjust" the maps to a rectangular
projection, using an image editor to rotate and/or stretch the map.  Perhaps Xastir
```

can do the reprojection, since it looks like it's doing it for the USGS maps.
That would be a big help.

Just to be a bit more complete, the OziExplorer (www.oziexplorer.com) shareware
program will display your own scanned maps or those you create, in addition to a
variety of raster map formats including USGS DRG. It's my favorite for most
mapping applications, but it doesn't do APRS :-(It may need a more versatile
track / waypoint file system for use with APRS, perhaps something like the ATM
format that made Steve's program practical.

Or Xastir (provides seamless coverage with topo maps). I think at
last count we supported 114 map formats with Xastir, including
seamless topos using USGS geotiff topo maps. We're in the final
stages of the release process for Xastir 1.1, so look for it soon.

It's on the list for the future, but I hard-coded the math that we're
using for the USGS topo maps. It doesn't use general reprojection
algorithms yet.

One thing that might help in the future is another program I wrote
that will crop the borders off a USGS geotiff map, rotate it
slightly, convert it to mostly rectangular, and save it as an image
file. It's written using Perl and is available from my ftp site.
http://www.eskimo.com/~archer has a link to the site. You could
convert, combine the images, draw your trails, then convert back
to tiff and add geoTIFF information back in with the proper tools.
You could also just use it to convert images for use with WinAPRS.

I like it too! I don't use it much these days though for the APRS
reason, and 'cuz it runs on an OS that I don't use much these days.

Hi Matt,

Why would you be willing to aide someone who is driving at risk?

Better to let the police nail the clowns and pay the price in cash then
have someone hurt or killed because they rely on an external snitch
system. Kind of defeats the purpose of Amateur Radio and cooperation
with civilian authorities.

I do not believe that alerting possible offenders solves
any safety issues in the long term. If anything it may
further aggrevate the situation.

Just my thoughts!

         No, but I believe in helping people where bad cops will use their
RADAR while the person is still on the open road and then try to nail them
with "65 in a 25" once they get into town.  And there's a LOT of that out
there.

snslay@swbell.net writes:

> Are you aware there are 3 sizes of "fat chumky green arrows" to choose from
> in SA?

Yes.     However, the largest size of green arrows covers up numerous
adjacent streets except at the highest mag, and the smallest size is hard to
see.  And the green color gets lost in the background of national forest land
and park areas (of which we have a lot in the west).

I am still lamenting the passing of Delorme's MapExpert which was the
forerunner of Street Atlas over 10 years ago.  It's GPS handler left a track
trail of intense  black arrows that:
1) Were not lost when the map was scrolled or zoomed.
2) Would record the entire trip for hours on end; not just the last few
minutes.
3) Could be saved as an instantly reloadable overlay; i.e. not the hoky
"playback" function that SA's track recorder provides.  You could, on a
cross-county trip,  shut down the program and GPS overnight and then reload
the track the next morning and continue to add to it.
4) Were resized automatically based on the magnification level of the map --
zoom out and the lines became smaller so as to not overlap adjacent roads;
zoom in and they would expand to just cover the width of the streets in
question.
5) Could be exported, along with the underlying map (via the clipboard) as
smoothly-scalable VECTOR images (not bitmaps).  These images could be loaded
into CorelDraw!, Adobe Illustrator, AutoCad or other vector-based draw
programs.

 I have been pleading with Delorme to revive these features in SA for 10
years now, so far to no avail...

```
> Why would you be willing to aide someone who is
> driving at risk?

    Let's not get into that discussion on the list.
My definition of 'at risk' is probably greatly
different than yours.
    Forget I said 'speed trap'. If it makes you feel
```

```
better, let's say 'cheapest gas prices in town'. No,
that'll upset the 'nothing even vaguely for-profit
related on the radio crowd' (if though it's a regular
drive-time topic on 2M repeaters everywhere).
    How about 'hot chick sun bathing in front yard'?
Who could possibly be against that?
    The point was, the ability to easily put objects
into the APRS stream (do a search of the list for
APRSdata.exe for examples) is rather nifty and, hey,
look, there are commercial companies doing it with
cell phones and GPSs.

In a message dated 1/21/02 6:49:57 AM Pacific Standard Time, k5qq@juno.com
writes:

> My radio will not transmit when I have the
>  dial set at 10151.5 LSB as it thinks it is out of band.

The standard (baseband audio) HF packet tone pair is customarily 2000/2200 Hz
(in the US at least -- the convention in Europe is a lower pair 1800/2000, I
think).

When you feed these two audio tones into an SSB transmitter set to LOWER
sidebad at a supressed carrier ( radio "dial frequency" ) of 10,151.50 KHz
LSB, you are actually creating RF energy at freqs 2.000 and 2.200 Khz LOWER
than the carrier freq.   In other words at 10,149.50 and 10,149.30 KHz.

You will get the exact same results if you set the transceiver to 10,147.30
UPPER SIDEBAND. This time the two RF frequencies generated will be 2.000  and
2.200 ABOVE the carrier freq.  In other words, THE SAME actual RF frequencies.

Summarizing:

Using LOWER sideband with dial set to 10,151.50:
10,151.50 - 2.000 = 10,149.50
10.151.50 - 2.200 = 10,149.30

Using UPPER sideband with dial set to 10.147.30
10.147.30 + 2.000 = 10,149.30
10.147.30 + 2.200 = 10,149.50
```

Using the UPPER sideband approach places the "dial frequency" (suppressed carrier) well within the band so that band-limited radios will transmit.

Some other considerations:
It has been a convention for decades with classic RTTY that tone pairs are transmitted on LOWER sideband; i.e, the on-air RF sense of the two tones is "upside down" relative to their baseband audio equivalents. The sense of which tone ("mark" or "space")is the higher of the two is critical on classic RTTY. Traditional hardware (and more recently soundcard software) RTTY systems have always provided an "Invert" function to compensate for either LSB or USB operation. For packet, it doesn't matter -- the packet modem is only looking for TRANSITIONS from one tone to the other -- not their absolute value.
Some HF radios provide a direct FSK operating mode where DC logic levels (0 and 5 VDC) instead of audio tones are fed into the radio to shift the frequency of what amount to a key-down CW signal, . Almost always, the 'FSK" mode on such radios sets the receiver to the equivalent of LSB (a legacy of nearly a half-century of RTTY) forcing you to use the LSB approach to determining FSK frequencies.

Rendered body type: text/plain

I have an interesting problem going one here.

Back in late September, I bought an Uninterruptible Power Supply (UPS) for my computer. This UPS comes with software that will automatically shut down the computer before the battery runs out in the even of a power failure. Nice feature, BTW.

However, the problem is that WinAPRS will NOT allow the software to shut it down. When the command to shut down is given, WinAPRS dutifully opens the box asking "Are you sure you want to quit WinAPRS?". And there it sits, until the battery dies and the computer is shut down as badly as if someone jerked the cord out of the wall. It's interesting to note that this doesn't happen with the "FILE-EXIT" command that I normally use.

Does anyone out there know how to make WinAPRS exit properly?

Thanks,
Earl

Well, one "kludge" approach to this problem would be the extremely useful and flexible keyboard macro utility "Keytext". This shareware utility from :
http://www.mjmsoft.com

can automate the typing of strings of text and other actions into practically any program running in Windows. Normally, it loads at Windows boot, and runs as a background operation with a button in the system tray. When you click it, you get a list of up 26 choices (lettered A-Z) of user-defined text strings, or other actions. It can simulate a phantom typist typing at human speeds or do a mass "paste" operation, simulate left or right mouse clicks, launch other programs if they aren't currently running . It can "type" text strings either stored in the program's menu, or read from external text files. [I have used it to "import" data into programs that had no provision for reading in external files by "typing" tab-delimited text files into a program's internal entry screen over and over.]

One of the most complex macros I have created with it (for reporting email spam) does a "Select All" and then a "Copy" in the currenly open email screen, launchs my web browser to my specific login URL at SpamCop.com, waits for and responds to the password challange, waits for the reporting form to appear, pastes the spam text into the form and then clicks the "Send Spam Report" button at the bottom of the form. This macro takes advantage of it's "Wait Until" and "Send Mouse Click To" capabilities.

One of it's features is the ability to lie in wait for a dialog box with a specific title bar or body text to appear, and then jump into action without human intervention, to mouse click a particular button. Or feed the dialog enough <TAB> characters to highlight the "YES" button and then send an <ENTER> .

592. [aprssig] Source for UI-DIGI eproms and other related info

From: WA8LMF2@aol.com
Date: Mon, 21 Jan 2002 17:34:23 EST
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-58293-2002.01.21-17.04.56--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

```
Several posts on this and other APRS lists have mentioned that getting the
27C256 EPROMs required for installing the UI-DIGI firmware into TNC2s is
becoming very difficult and expensive. BuxCommco, the mail-order enterpise
run by K4ABT of
   http://www.packetradio.com      fame is located at:

   http://www.buxcommco.com

where he sells a vast variety of minor radio accessories, antenna parts,
sound card interfaces and kits, plugs, connectors (including the hard-to-find
8-pin INLINE mic jack and the 6-pin mini-din "packet connector" cable), etc.
 I have ordered stuff from him several times and his service has always been
fast and accurate.

If you go to one of his catalog pages at:
   http://www.buxcommco.com/page3/bccpage3.htm

and scroll to the bottom of the page you will see
   27C512  EPROM
   Price Each $4.50
   Order number = EP-27C512

These work directly in TNC2 clones such as MFJ-127x and PacComm devices.
Program the UI-DGI firmware (a 32K 27256 image) into the UPPER half of the
27512's 64K memory space and it works perfectly.  Just plug it into socket
U23 of the TNC2; no changes needed!

           --OR--  Do a TNC firmware  "double-decker"

Bend pin 1 of the 27C512 EPROM out so it misses the socket and connect it to
a single-pole double-throw switch that can either ground pin 1 or connect it
to +5 volts.  You can then copy the TNC's original firmware to the lower half
of  the '512, put UI-DIGI in the upper half,  and be able to switch back and
forth between normal TNC operation and UI-DIGI mode without unplugging
eproms.  Very handy since you need the original firmware to be able to enter
the TNC's CALibrate mode to set tone freqs, deviation, etc.

BTW, an excellent summary of how to align a TNC2 is also on K4ABT's website
at:
    http://www.packetradio.com/1270algn.htm

> I have often considered putting 'speed trap' objects into ARPS so
> that both locals and visitors... would see them...

Yes, I am disapponted that more people don't use the objects in APRS more
for reporting things like that as well as accidents and backups.
Most people dont realize how easy it is. Here are two ways. The first
is from scratch, the second method is with prior planning and everyone
should do it:

>From scratch:
1) APRS menu, change your MYCALL to the name of the object-#
2) If needed change your status to comment on the object
3) Send your position report a few times and be sure it was digipeated.
4) Restore #1 and #2 for normal operation..

With prior planning:

OR if you are a road warrior and have the room, put a permanent setup like
that in one of the PM's. Then all you have to do to mark an "incident"
is hit that PM number, hit BCON to send a packet or two, and then hit PM
to get back to your normal config. That is ONE-BUTTON operation!]

For this to work, every incident must have a unique name because in APRS,
any two objects with the same name will replace each other. In this case, I
suggest using these names and add an SSID to make it different from
someone elses. I suggest making the # match th elast letter of your call,
so that we can know who placed th eobject. A=1, B=2 and so forth.

WRECK-#
POLICE-#
SLOW-#

where zzz is your suffix. That way your object is unique and there can be
other wrecks showing in the same system at the same time.

**** In summary, since most of us dont care what the problem is, other
than to know that there is a TRAFFIC JAM, then if everyone carried at
least the SLOW-# in their last PM, then we wouild all benefit by ONE-KEY
entry of Traffic slowdowns!

Wow, neat idea...
Since they are not repeated other than twhen first transmitted, their age
will show on the radio front panel and they will slowly be bumped down and
off the list. But your other APRS buddies will love you for posting it!

Rendered body type: text/plain

A little off topic, but since it's my aprs pc, I'm gunna ask.

Just loaded win98se for use in my aprs server (aprs plus on port 14439 and
KIPSS too). PC is a 233mhz no name brand laptop with PCcard lan card. It
locks up 1hour and 30 minutes after I stop using it. I can press CNTRL ALT
DEL and get the task manager dialog that tell me that MSGSVR32 has stopped
responding. I've read about it and found that it controls sound, and some

PC card network stuff. I thought aprs plus (with speech option) was a culprit, and shut it down. Still locked up. Removed network card, still locked up. Went into bios and disabled the motherboard power mangement, still locks up. Went under win98 power management schemes and told it to never go into standby or power down the HDD, still locks up. The thing that is consistant here is the 1 and a half hours after I stop using it lockup time. Hoping someone can point me in the right direction.

Wes

I remember seeing a few years ago an antenna mount for the hatch back of the chrylser / dodge minivans. I think it was on a website with a license tag frame antenna mount, but can't locate either one now. Just getting a "new to me" minivan and need an antenna mount for it. Anyone got a web site?

Try checking your motherboard BIOS setup (usually accessed by hitting <DEL> or <F2> during the power-on self-test before the machine starts booting and search through the various menus there.

Many machines have HARDWARE-based power management (with settable timeouts for harddisk spindown, display backllight, switch to SLEEP mode, etc) that won't surrender control to Window's software power management. These were intended to endow older dumber operating systems, such as DOS, with some of the power management features that are standard with Windows.

Often there will be an item in one of the BIOS menus setup menus such as "Plug-N-Play Operating System Installed   YES/NO". If this is set to "NO", no amount of twiddling in Windows will have any effect. Set to "YES" causes the motherboard hardware/firmware routines to surrender control to Windows.

```
Help needed.

I just tried to use my Laplink program to transfer some APRS files to a new
computer and found one of the original disks is corrupted. I contacted
Traveling Software but they do not support a version this old.

If anyone on the SIG has a copy of LapLink for Windows ver 6.0b and would
be willing to copy disk 2 onto an original disk 2 that I will provide
please contact me direct. Mine is an original registered program.

Thanks for any help anyone can provide.

I have a program named Buzof and it comes up at boot
time and looks at any window waiting for a reply.  It
then checks a table to supply the right answer.  I have
been using it for over 2 years and it works great.

I think the registration is $15 but is well worth it.

check their web site at www/basta.com

I drove a Dodge Caravan for some years. I used mag-mounts for
everything above 50 MHz, but the HF antenna was on a DC Sales Tenna Hitch
-- I think it was marketed by N5DC, but I have no idea if it's still
available. My AES catalog dated Spring/Summer 2001 still shows it for
about $35.

         Thanks, Don.  I was REALLY hoping someone knew how to make the
program exit right away, like perhaps a .pif file or something.

602. [aprssig] javAPRS 2.2b01 Released

From: "AE5PL Lists" <HamLists@ametx.com>
Date: Mon, 21 Jan 2002 22:01:10 -0600
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-58351-2002.01.21-22.31.22--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

```
This is what is new since 2.1 build 04:

 PNG image support (japrspng.cab, japrspng.jar).
 autoFit parameter added to stretch images/maps to fit window.
 Added multiple map projection types selectable for GIF maps.
 Support TIGER projection.
 Support MapBlast projections.
 Support NWS Radar GIF projection (new page for proper top-left and
bottom-right parameters (http://www.ae5pl.net/nwsradars.asp).
```

Added Expedia support.
Added zooming for GIF maps.
Added display of area objects (\l).
Added display of sign post (\m) objects/items.
Added filtering by icon.
Added metric display support.

Corrected DosMap drawing.
Reduced redraws when scrolling the browser window.
autoReload only reloads GIF maps.
Improved speed and memory handling.
mapList no longer fussy about name/file conflicts (as long as each menu name is unique).
displayOnly and dontDisplay don't require trailing slash.
Multiple parsing/display bug fixes.
Server bug fixes.

The new japrs.jar and japrs.cab can be downloaded from http://javaprs.ae5pl.net Some sites may display maps a little differently now but this was necessitated by using proper map projections instead of the "flat" (LatLon) projection. Also, the size has grown (especially japrs.jar). I am trying to keep it small and this is why I have put PNG support into separate files. Any major future additions (such as shapefile support) will also be in separate files.

Note: The download page has a copy of the license for use. javAPRS is still free, but it is restricted to personal and noncommercial use. Anyone wishing to use it for other purposes must contact me for approval. This is required for using MapBlast and Expedia maps.

Rendered body type: text/plain

The earliest version of LapLink that supported native Win32 long file names is ver 7.x aka LapLink95. One expedient is to use WinZip (which IS aware of long file names) to pack the files/directories in question into a zip file with a short name, LapLink it to the other machine, and then unpack it with a second copy of WinZip 8.x.

Since the install file for Winzip is a short name, it can be transferred to the second machine, if needed to set up the 2nd copy of Winzip, with any version of LapLink.

604. [aprssig] Bad Packets from Iowa

From: greg@clubnet.net
Date: Mon, 21 Jan 2002 21:16:28 -0800
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-58373-2002.01.21-23.46.37--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I have captured two badly formed packets which appear to be emanating
from Iowa:

```
WB0WNX-6>APZ17,WB0WNX-4,N0BKB*,WIDE:!4211.11NN09548.11W#PHG5430/APRS
DIGIPEATER (UIDIGI 1.7)
1WB0WNX-6>APZ17,WB0WNX-4,N0BKB,N0JUP-1*:!4211.11NN09548.11W#PHG5430/APRS
DIGIPEATER (UIDIGI 1.7)
1NA0R>APW246,RELAY,WIDE:=4143.53N/09343.23WWPHG5170/WinAP

GFZ>APW251,N0BKB*,IOWA,IOWA:N0BKB At Greenfield, Ia
AirportGFZ>APW251,N0BKB,KI0BW-4*,IOWA:N0BKB At Greenfield, Ia
AirportGFZ>APW251,N0BKB,N0AN,KI0BW-4*:N0BKB At Greenfield, Ia
AirportW0NWS>APW251,WB0WNX-4,N0BKB*:_01220442c198s011g013t038r000p000P0
```

The only reason I caught these is that they are forcing a buffer
overflow condition in APRServe. The two packets are being passed by
first.aprs.net and AHubWest and are causing temporary disconnects from
these two sites to second.aprs.net.

Someone in the Iowa area may want to check into the source of these
packets.

Greg

Oh my! Do you mean that I am supposed to actually DO something when I hear a
distress call?

>Also, I presume by the silence that no one has
>noticed a software bug with
>how the D700 handles this message code.

Hmm, don't want to stir up a hornet's nest by setting my status to
Emergency. There probably hasn't been much testing due to worries of this
type. Perhaps a test period should be defined, similar to the test period
for ELTs. If I'm not mistaken, you are allowed to fire up an ELT within 5
minutes of the top of the hour for testing. You are allowed to turn it on
for a short period, to make sure you can receive it's transmissions on your
aircraft radio. Any short transmissions within 5 minutes of the top of the
hour are generally considered to be test transmissions, and will not cause a
call out of the cavalry.

However, long transmissions during this period, or ones that extend beyond
the test period will cause a reaction.

A solution to test your own equipment, would be to move to a non-populated

FM simplex frequency for a short test.

The license plate mount is made by Lakeview Co.
http://www.hamstick.com/Tm-1.html
Somebody makes a mount for Chrysler minivans that bolts to some existing
bolts in the door jam. I don't know what years it's for. I know
someone that has one. I'll see if I can find out more on it.

I have the Lakeview license plate mount and it works great. Very solid
and well built - stainless steel. A little expensive tho. ($45)

Hmm, sounds like you ended up being one of the people you are complaining
about! Of course, I could be wrong, and you hold a license to operate on
10.050, and communicate with unlicensed stations.

Not looking to start a war, just pointing out that when you wrestle with a
pig, you both end up covered in mud!

That's kind of fun.  We did that a couple years ago on the way to the
Dayton Hamfest.  I was the passenger with the lap top running APRS.  We
were spotting all kinds of "road hazzards" like radar traps, accidents,
traffic slow downs.  Great use of APRS as electronic counter measures!
I don't know how many people saw the spots though.  At the time we
didn't see much APRS activity.  Different story now though.  Lots of
APRS activity last year.

609. [aprssig] Igate Connections to Core Servers

From: greg@clubnet.net
Date: Mon, 21 Jan 2002 22:06:44 -0800
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-58413-2002.01.22-00.36.28--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

```
The past few weeks I have doing some administrative clean-up on the
second.aprs.net server and have found that there are many Igate stations
that are improperly connecting to port 1313 of the core servers
(first,second, and third.aprs.net).

Port 1313 is a linking port meant to be used only by the core servers.
It does not carry the full data stream.  Therefore, when an Igate
initiates a connection to port 1313, it may be missing data which could
result in missed messages to its coverage area.  In place of port 1313,
I would suggest that connections be made to port 23, which does provide
the full data stream (real-time without history dump).

I have attempted to contact all the Igate stations for which I have
e-mail information, but there are other stations which I have been
unable to reach through e-mail.

I recommend that all Igates currently using port 1313 make the switch to
port 23 as soon as possible.  I plan on upgrading my server next weekend
and part of this upgrade will limit port 1313 connections to the
intended core servers only.  Once the upgrade is made, other stations
will no longer be able to access data on this port.  A similar change
may be upcoming on the other core servers, so it's best to make the
change in your connections list to all three servers.

```

> Hi Matt,
>
>Why would you be willing to aide someone who is driving at risk?

Agreed.

I hate to armchair lawyer, but I will. Many government agencies and city/county/state prosecutors hold that warning other drivers/individuals of locations of "speed traps" and other police operations to be obstructing justice. Even if obstructing justice is a misdemeanor, a group of people engaging to obstruct justice becomes a conspiracy. Conspiracy to commit a misdemeaner is a felony. Committing a felony with the aid of a transmitter or receiver becomes a federal offense...

I would also argue that the FCC grants you a license not just based on your ability to pass a test and obey rules, but also on your character. The FCC can revoke your license even for conduct not related to amateur radio activity.

Please remember that many police and DPS/Highway Patrol officers are also licensed amateur radio operators. To use amateur radio to thwart their efforts is counter productive. If I were a member of law enforcement, I'd consider it a slap in the face. If the local police found out about some APRS "traffic warning" net they might react by stricter enforcement of other vehicular regulations to every vehicle they see with a 2 meter antenna.

But that is the question ... is/should an "Emergency" Message Code be
equated with a "MAYDAY"?  What is the purpose of the Message Codes
"Priority" and "Emergency".  These are terms familiar to NTS folks where
these terms are used to identify the precedence of the information...

Sorry, I was not able to duplicate the scenario. I went to an open packet frequency, transmitted some emergency packets (with "test" as status text) on my TH-D7 on very low power. The D700 captured them fine, and the home APRSdos (PK-88 TNC) station did the obligatory "zoom in and beep like crazy" thing.

The only thing I can possibly think happened was that your D700 tried to digi the emergency packet but had a low battery and shut down on undervoltage. However, you would have noticed the same thing on receipt of other types of packets...

73,
Skip/K3FOR

>>Perhaps a test period should be defined, similar to the test period for ELTs. If I'm not mistaken, you are allowed to fire up an ELT within 5 minutes of the top of the hour for testing. You are allowed to turn it on
for a short period, to make sure you can receive it's transmissions on your aircraft radio. Any short transmissions within 5 minutes of the top of the
hour are generally considered to be test transmissions, and will not cause a call out of the cavalry.

>>However, long transmissions during this period, or ones that extend beyond the test period will cause a reaction.

>>A solution to test your own equipment, would be to move to a non-populated FM simplex frequency for a short test.

> anyone there was an actual emergency.

I think you have to assume it is an emergecny until you can disssprove it.
I had Kenwood install an "ARE YOU SURE?" prompt on the Kenwoods before the
user could actually set the emergency bit. And since Kenwoods and a few
Mic-E's are the only things that send the EMERGENY message, then it should
be safe to assume that it was intentional.

But since the MIM's and TTII and TAPR Mic-E's dont have such a double protection, one might consider that in their response...

GO back 4 years when an overturned car in a ditch in PA was found with occupants because of an APRS emergency message...

With the mobility of APRS and map view, we should be able to rapidly respond by looking at the map, noting the voice repeaters in range, putting out a voice alert to anyone in the area to confirm it and/or calling 911... no matter what you do, someone will criticise it. But just do what you think best... based on your knowledge and experience with all factors involved in the situation..

Rendered body type: text/plain

When I went to put TRAFFC Objects into my D700 for reporting traffic problems along the way with ONE-BUTTON on my D700, I found other uses for the PM5 as well. Here are my settings for PM5:

```
MYCALL:      TRAFFC-4    <choose SSID randomly or match your last letter
XMIT:        MANUAL      <so that I only report the object ONCE or so
STATUS TXT:  BACKUP/SLOWDOWN/INCIDENT(APR)   <My SUFFIX on the end)
PATH:        RELAY,WIDE  <you only want it to be local
BAND-B:      146.52      <so I can hear any other locals in the same mess
Voice Alert: OFF         <meaning, do NOT set CTCSS 100
```

Manual, so that I can control how often I transmit it until I see that it was digipeated in the local area. And so that even if I forget to change back to normal mode in my other PM's, I dont keep transmitting as TRAFFC!

Voice Alert is OFF, so that I will HEAR packets and be reminded that I am in PM5! Not only is Band B programmed with 146.52 for ease of communicating direct with others in the same traffic mess, but you can also then use this PM5 as a quick QSY for "52" at any time.

Thus I get triple use out of this PM:

1) One button traffic reporting (push BCON button to actually XMIT it)
2) Quick QSY for 146.52 operations
3) Quick ctcss disable on 144.39 if I want to listen to APRS channel
4) Possible temporary DIM setting while you get out of the car

I will call this TRAFFIC REPORTING and add it to my D700 WEB page:

D-700 APRS SETUPS: http://www.ew.usna.edu/~bruninga/d700-faq.txt

Any other compatible uses of PM5?

I was just thinking about suggesting something along these lines. Now lets take it a little farther.

-There are some areas that have a formal/informal commuter traffic net. If they have the same net control stations let's set them up with a working APRS display so they can SEE what Bob has proposed and manually insert the other voice reports.

-See if we can make a specialized mode similar to the WX mode in WinAPRS so you can clean up the display.

-Also check in to the State DOT sites that have this traffic report capability and see if somehow we can stream this data in for those with net connectivity. This is probably just some GIS/Arcinfo type data. While we are at that point it would be fairly easy to incorporate any other GIS data streams either static or streaming.

-Keeping people trained to do this with manual inserts might finally get some more use of the real benefit of APRS, doing things like skywarn. You don't have to have everyone who is helping out using APRS to get a good visual representation of the event. Local emergency managers love visual spots of their resources and this system has everything to do it, we just need people more familiar with how to do it. Traffic reporting is both a practical way to do this without seeming like you are not providing useful data to someone.

Just rambling I guess.

Brian, N2KGC

Hi, Bob. This is not direct help with your Laplink problem, but you might look into the "Direct Cable Connection" available on the Windows machines. This supports file transfers between machines using either serial (COMx) or parallel (LPTx) ports. You need a crossover cable for the connection, but if you are using Laplink, you already have the cables. Direct Cable Connection is not as neat as Laplink, but it works and might get you out of a bind right now. Call up Windows HELP and look for "Direct Cable Connection". Hope this helps.

Bob Bruninga wrote in part:
"... And since Kenwoods and a few Mic-E's are the only things that send the EMERGENY message..."

So there's no way to generate an EMERGENCY message in APRS DOS? I've checked the documentation, and find references to how the software reacts to an alarm (and have seen it in action with WX stations), but nothing on the ability (or lack thereof) to generate EMERGENCY beacons.

I'd also be interested in hearing if any of the other software (APRS+SA and PocketAPRS to be specific)supports this function.

The EMERGENCY message is an integral part of the Mic-E packet. That is
why no other software generates it (all other software use standard
packet formats).

```
I know that I have seen it somewhere, but what is the secret to making a
PK-12 work on APRS?

I have tried 2 different TNCs and 3 different computers (APRS DOS) and even
though the computer talks to the TNC, I get     Hdr?> and No> before every
packet and no display on the maps.

Tom/W4OKW

Can't recall the specific commands, but if you use it with a terminal
program do you have headers on a different line from the information?
Something like "header of" or "headerln off" should combine them again.

Also check mfilter, make sure it is disabled or 0.  That'll help get
the MIC-E packets through without getting garbled.

AEA headers also have callsigns in a different order than TAPR-2
headers.  Hopefully aprsdDOS handles switching them around.  I
suspect it does.

I used a PK-12 with APRS-DOS for a while. APRSdos comes with a separate init file that has special settings for AEA TNCs, and it worked pretty much out of the box for me.

Sri, Bill, but I'm a 30 <> 2 meter RADIO Gate.

The IGate has an I in it.

Do all my stuff via RF. The Packet BBS doesn't even have a phone line hooked to it.

I'm gonna put this on the APRS reflector, there are lots of non-RF types there and I'm sure many or ateast one can answer your question.

My PK-12 works fine on APRS now. I did have to play with it some. I use it
as a stand-alone and with APRS-SA.
One trick is to use the reset command to get it back to default settings and
go from there.

You got that right!

Probable conversation:

Dispatch: "911, how can we help you?"
Ham: "I want to report an emergency at location xxxxxxxx"
D: "Please tell us your name and address."
Joe Ham does as he is asked.
D: "What is the nature of the emergency?"
H: "Gee, I don't know."
D: "Are there any injuries?"
H: "Um, er, sorry - I have no idea."
D: "Are you at the scene?"
H: "No, I'm sitting in front of my computer at home, many miles away."

-- pregnant pause --

D: "Sir, are you aware that making prank calls on 911 is a criminal offense?."

Could have been a purse snatching, a kidnapping, a single car accident with minor injuries, a wrecked train carrying nuclear waste, or a sinking cruise ship. Those require radically different aid responses, but who knows what to send?

Maybe it is time to start building some specialized how-to documents for the finer points of APRS. I can think of a few that would be handy, many APRS users have a good grasp on the basic operation but we could draw up specialized mode how to directions for things like SKywarn, PCsat, DF ops, SAR uses, and marathons.

This could be done for all the different flavors of APRS. I know there is quite a bit of documentation out there, but some time spent by the people who do these special parts of APRS can save many of the average users a bunch of time. This would also help get the advanced aspects of APRS in to the mainstream faster and easier.

The Linux community has started this and it helps quite a bit.

Most of the authors agreed to trigger the same reaction to any message that had EMERGENCY or HELP (I forget the exact context), but I've been so busy, I have not added it to APRSdos yet. Maybe some of the other authors have... and will comment on the exact ssyntax we agreed to...

Bill,

Where do you live in SW VA?

I lived in Pulaski many moons ago and my Mom's family from Roanoke.

When I was a baby ham I used to go visit Graham Claytor's
shack in the basement of his house on the shore of his lake.

Lotsa Collins and RTTY equipment.   I think his son
was Sec of Navy for Nixon or Reagan.

I have some GPS units for sale. They are just boards no display or
controls, great for an APRS tracker. You can program them with your
computer. Just add TNC and Ant and you have a small little APRS
tracker. Want more infomation??? E-mail me!! I have all the
infomation on the units and all the plans to build the interfaces.

Ui-View, APRS+, or WinAPRS should all have igate capability.  You may
need to register the shareware in order to turn on that functionality
though.

If you want to go with Linux, there's Xastir and aprsd.  Both free.

>

Maybe that's the case in a large city - but in a rural area, that could
easily tie up a car for 60 - 90 minutes just to find its a ham playing with
a new toy.  You can be sure that they won't do that many times!  It's bad
enough that there is a legal obligation to respond to abandoned 911 calls
for service.

If you want a specific example - last month I responded on a call to a car
80' down in a ravine.  It took two hours of code three response to get to
the scene, and another hour to get to the casualties - ultimately with me
being winched in by helicopter to provide initial medical care until ground
units could get close.  The car went over the edge at 11am - the alarm was
raised at 1pm - we got on scene at 3pm - extricated the last casualty at 5pm
and got back to station at 8pm.

Most agencies use priority based dispatching - and I would guess that most
agencies will not give a high priority to the likely scenario detailed by
Tony, KD7TA.

On the single occasion that I used 'Emergency' the scenario was a big-rig
roll over, 2 people and 20 animals trapped, road entirely blocked, no cell
phone coverage and no response on 2m.  I got an email two days later asking
what happened from a ham on the opposite coast.

It is a great concept - but I shudder when I see suggestions such as an
Aircraft Mayday system.  At the moment, it is largely unused because it
doesn't work.  We, as hams, need to have a MOU on use of the emergency
beacon, and then perhaps, there is an opportunity for Bob, Stan or someone
else to write a piece for the Dispatcher fraternity.

They are soon to be struggling with GPS equipped cell phones, On Star, other
tracking products. Maybe we can be proactive here?

For those of you wanting to know what to tell your mapping software about a NWS radar GIF image, try http://www.ae5pl.net/html/wxradarsites.htm This gives you information for both "flat" mapping software and stereographic mapping software.

Want to know where to start when creating a web page to show APRS in your county using javAPRS? Try http://www.ae5pl.net/NWSCodes.asp This information is direct from the NWS shape files.

Rendered body type: text/plain

I am NOT counting on APRS as a sole-source communication system for aircraft. Since I fly with the TTII anyway, emergency or not, I figured that adding a "Mayday switch" certainly can't hurt. I have called Mayday for real while flying and the SAR effort was lame at best. The state police were called out and were just generally driving around rural Virginia looking for smoke. Lucky for us our airplane did not burn, so they drove right past us while we waved. I guess the thought process was something like "Couldn't be that airplane in a farm field, it isn't burning". We ended up walking the 300 yards from the airplane to the police station they all came from. ATC only had a vague idea of where we were.
I am thinking if I have an engine out and start sending MAYDAY with a WIDE7-7 path from a few thousand feet it might get some attention. I have been operating boat and aircraft radios for a long time before I got a ham

license and I would NEVER ignore any kind of distress comms. I once tried to
aid a vessel off the coast of Nicaragua that for some reason had S9+ into
Annapolis and no place else. Eventually a local fishing boat came on
frequency and took over what turned out to be mainly a need for moral
support.
It is a shame if the emergency features and potential of APRS get wasted
because it is ideal for this purpose.

README's on all these subjects have always existed in the original APRSdos
docs. (List follows) It would sure be nice if someone experienced with
the other programs would read them and update them to include more generic
references to the functions and or spell out thw keystrokes for the other
programs such as WinAPRS, APRS+ and UI view, Xastir and the like...

Here are just some of the almost 90 such topical HOW-TO README's in
APRSdos: Just add .TXT for the name of the FILE:

DF,   I-O,   FIELDAY,   METEOR,   CAVES
WX,   MOBILES, IDEAS,   SPACE,   DXCLUSTR,
MARATHON, RACES,   HF,   PACSATS,   ACARS,
AIRCRAFT, ACARS,   NTS,   DR,   MILEMARK,
BOATS,   OPT-OUT, ZIP-LAN

and many more...

```
To the SIG, here is part of a question I posed to Bob privately. Just got
to thinking that I might as well give everyone a crack at it.

I have a question as to which of the Palm or Handspring PDA's ( or any
other brand for that matter) would anyone recommend for use as an input /
viewing device for the Alinco 135tp?  I liked Bob's idea of using one as a
user interface for the Alinco .  I just can not justify the cost of the
Kenwoods.  Yes I am aware that when bought new the combined cost is similar
however I am currently attending college and have had several opportunities
to buy various PDA's at fire sale prices. I just don't want to buy one that
is unsuited.  The Palm aprs site does not describe the features /
attributes of the units.   I would like to see a rating of various models
as to their suitability for viewing data and, maps.  Also important is the
ease of entering / changing status or beacon text.

>I know that I have seen it somewhere, but what is the secret to making a
>PK-12 work on APRS?

Can you communicate with the TNC using a terminal program, such as Hyperterm? If you can't do this, the APRS program isn't going to either. The PK-12 uses an autobaud routine to automatically set itself to the same rate as the terminal. Once this is set it remembers it (if the AUTOBAUD command is still set to its default value OFF. If you set AUTOBAUD ON it runs the autobaud routine every time it's turned on). If you're not sure whether this has been done, try entering a RESET command, then type a single asterisk (*). This should trigger the autobaud routine and cause it to display the sign-on message. Once you get it communicating to this level, the AEA init file which is included with APRSdos should get you working.

Another possible glitch is with the firmware version. If you have V7.0, you need to set BBSMSGS ON. If you have V7.1, set BBSMSGS OFF. This setting is discussed somewhere in the APRSdos documentation. I don't know what setting is needed for other firmware versions.

73,
Roger Grady K9OPO

        Really? That's quite a coincidence. There were 2 Claytor
brothers that I know of, one was president of Norfolk & Southern, the other
(I think) president of AMTRAK.

Hi everyone,

Has anyone experienced using APRS in off road trips? Interest on this topic has arrised on a local off road group as many of their SUV's are equiped with a GPS, VHF equipment, and in some cases also HF and laptop for moving map. Any comments, tips or websites are welcome as this would be a great oportunity to expand the APRS community in our country.

I use a Palm IIIc with pocketaprs for my station (KPC-3+ and Kenwood 2m tnxcr). My friend uses a IIIc with the alinco 135. The color display can't be beat for map display, and with 8Mb it has plenty of memory for aprs and normal pda stuff (I use mine as a productivity tool, too). The IIIc can be picked up for $200 new (watch ebay carefully) which makes it much cheaper than the newer palms. As for ease of text entry (changing status, etc) it is easy to do within pocketaprs. This is assuming that you are proficient at entering text via graffiti. If you haven't done that before, don't worry. It's not that hard to learn. Some of the special characters escape me every now and then, but I can enter text better than I can type on a keyboard. Of course, I'm no typist!

I'm not familiar with the visors, but I'm definitely a palm os guy (rather than CE).

I still have two problems/issues/questions with this ...

1) The only info I had available to me at the time from the station sending the Emergency position comment were Latitude and Longitude and Grid square ... Not sure how a 911 operator would respond to that ...

2) No one has answered the fundamental question ... what was/is this feature intended to communicate? Should it be equated to a distress call?

Peace and 73,
Stephen

I've been working on learning how to tune in APRS (and other packet signals)
on HF and wouldn't mind hearing the questions and answers to that myself.

Alejandro,

I live in Colorado and do quite a bit of off-road travel on ATV's and
pickup and never leave home without at least a 2m. I recently bought a
Kenwood TH-D7(G) to replace my old Icom 02-AT. I have a Garmin GPS III Plus
mounted on my Polaris 500 and will be making a mount for the D7. With that
hookup, I will be running APRS from the back country. Look for my call in
the Spring/Summer months (N4ATA) tracking through the high country of
Colorado.

I ran some 30M APRS with a Kenwood TS440S. I set the system up to
beacon via ECHO. Then I kept sending a position and varied the freq by
a few Hz and did it again. I kept doing that till I heard digis come
back. Wrote down the low freq and the high freq where I could hear
digis come back then went right in the middle. Of course the digis I

heard could have been off freq, but I figured the center freq would at
least get me into a couple digis. The I put that freq into memory.

I was in CAP for quite a few years. Maybe things have changed, but we took ELT's pretty seriously. I have also just retired from a career in the USCG, and by Federal law, we cannot ignore EPIRB's. Probably 90% or more of EPIRB/ELT hits are just idiots who take it out of the bracket to paint a bulkhead or something, then forget about it. Most EPIRB's are located in a shipyard or marina at the dock. The USCG spends a LOT of money and time chasing weak or mysterious beacons, sometimes only heard by one satellite pass, but the search goes on for days involving aircraft that cost thousands of dollars an hour to operate (ever look at the cost of a C-130 plus crew?)

I've also gotta speak up on the subject of people who substitute APRS and other AMATEUR modes for dedicated SAR systems. Saving a thousand bucks or so by relying on APRS or Ham modes/freqs instead of installing an EPIRB or ELT on their boat or plane is simply stupid. If your life isn't worth the money, then why bother the rest of us with distress calls that have a VERY LOW probability of being successful. This is a HOBBY, and not intended for the immediate safety of life. Our freqs are NOT monitored 24/7, our SAT's are unreliable at best, and most of us are not properly trained to respond even if we do hear something. Use the systems that are designed for distress, they are RELIABLE and monitored all the time, the equipment is bulletproof and the people listening take it seriously. Sure, APRS might work, but why chance it to save a few dollars? And for those who panic and hit the MAYDAY button just because they got a flat tire on the interstate, or ran out of gas while fishing offshore, so sad. Take responsibility for YOURSELF and learn how to cope with an expected situation. Otherwise stay home and watch cable TV. It's just not life threatening or even an emergency, unless you're a complete incompetent and can't look out for yourself. If you're NOT carrying flares, signal triangles, appropriate clothing, those pesky expensive little things that you figured you'd never need, then don't expect your radio (that means someone ELSE) to save your backsides!

Go ahead, flame me!
Won't change my opinion...

I did some APRS last year when we were exploring some jeep roads in
Colorado. Don't know how much good the APRS did, but the moving map
display was a big help. We had some paper maps that showed the jeep
roads that were hard to follow, but comparing them to the Delorme maps
on the laptop was useful. I also did some hiking in the mountains with
APRS (D7 & Garmin 12MAP). Again I don't think the APRS did much for us,
but I had some QSO's on some nearby repeaters, so the D7 came in handy.
And I wouldn't think about hiking in the mountains without a GPS.

I would certainly like to see something on Skywarn activity, how others are
doing it, etc. I've gotten our local club and ARES group interested in
using APRS during storm watches, and we are putting up a digipeater in the
next month or so, in time for the spring storm season here in Oklahoma. Is
there a Skywarn or ARES icon for APRS? We are trying to come up with a
symbol that would be distinctive enough to be easily recognized both by our
radar man and by the NWS office in Norman, OK, which has an APRS screen at
their ham station. Any and all suggestions appreciated.

Go to www.mapblast.com, click on the Advanced Search button, and enter in
the Lat/Long. You'll get a map of the area, with a cursor on the spot in
question. You can use that information to help the dispatcher figure out
where you are talking about.

> 2) No one has answered the fundamental question ... what was/is this
> feature intended to communicate? Should it be equated to a distress call?

>Most of the authors agreed to trigger the same reaction to any message
>that had EMERGENCY or HELP (I forget the exact context)

If we are going to implement a distress call into APRS, it had better be
WELL DEFINED, and not used lightly.

I would not consider a "roadside emergency" (flat tire) worthy of this type
of beacon. My choice for a word to associate with a distress beacon would
have been MAYDAY.

MAYDAY is a universally used term, in all radio communications. It's use
should be restricted to only the most grave and immenent danger to human
life or limb.

The words EMERGENCY and HELP are much less universally recognized, and are
commonly used for much less than a truly emergent situation. (Emergency
liquidation sales at the local furniture store come to mind...)

Of course we'll hear, because the KENWOOD radios implement Emergency, it's
written in stone... Kenwood does not drive the marketplace, they should
respond to user demand!

I would strongly suggest that if APRS is going to use a distress beacon
mode, it should be implemented as a MAYDAY, and used only for that purpose.

There is NO grey area where a MAYDAY call is concerned.

Good points!

Perhaps some of the SPEC folks and/or Authors could please respond to what
they envisioned for the "Emergency" Message Code in the Spec.

I agree with your point about "MAYDAY".   That IS the legal distress signal
and cannot be ignored, but everybodies notion of an "EMERGENCY" is going to
be different. Fortunately, this does not seem to being abused (again, this
is the first time in many years of APRS'ing that the "EMERGENCY" bells and
whistles went off), but I think it is a good question as to what the "alarm"
actually means....

Peace and 73,
Stephen

It was meant to be the digital equivalent of using the autopatch to call
911.  Life is a judgment call...

Bob

Thanks so much for the clarification.

That would probably be a worthy addition to the Kenwood documentation.  I
don't know what the TTII documentation says about this ...

Thanks Again!

Then it is intended only to mean send help needed immediately to protect
life or property (fire, police and/or ambulance).  So it would be improper
to use "emergency" at the scene of an emergency, for example a plane crash,
if helping with communications once the incident had been reported to
authorities.  So use "priority" at the scene?

I think you may be overreacting about the simple notice of a possible speed
trap. In many states speed traps are illegal. Go to
http://www.speedtrap.org/stetlaws.htm to see a partial list of states which
prohibit speed traps--and then happily use them anyway. Many small highway
burgs enhance their general funds with unfair use of speed traps (and
collect fines at roadside!). Instead of a discussion about conspiracy, how
about a discussion about due process of law.
A speed trap can certainly be considered a "Road Hazard" and as such might
be appropriately used as a temporary object on the APRS map. Of course Ham
radio operators are usually too busy talking on the radio to drive
excessively fast. Right?

Hello all:

For a number of years I have been operating a 30m/2m gateway station 24/7 using Kenwood TS-440s and a Kam. The radio dial reads 10.150.00, the Kam tone frequencies are 1600/1800. I suspect that 1600/1800 is 'standard' for the Kam and perhaps other Kantronics TNC's (I could be wrong, it would not be the first time). This places the rf signals at 10.149.200 and 10.149.400. This is ten hertz different then the numbers quoted below. It's working as well as can be expected for HF packet. I have had numerous brief QSO's. Have I been doing it wrong all this time? Does ten hertz really matter? Should I change? Comments please.

Hi Glenn,

If you're doin' it wrong lotsa us are.

I use the KAMPlus at 10.150.07 MHz.

We're all on the same frequency, so that's what counts,
along with bein' inside the 30 meter band limits :-)

On Tue, 22 Jan 2002, Alejandro Fernández Preda wrote:

> Has anyone experienced using APRS in off road trips? Interest on this topic has arrised on a local off road group as many of their SUV's are equiped with a GPS, VHF equipment, and in some cases also HF and laptop for moving map. Any comments, tips or websites are welcome as this would be a great oportunity to expand the APRS community in our country.

I've used it while heading into my bow hunting area, and darn near
regard my normal commute as heading into the boonies as well.
I used to run 25 watts to a 1/4 wave mag-mount antenna on the roof
of my Jeep. It wasn't heard much.

I've since switched to a 50 W 2-meter rig with a 5/8 wave antenna
permanently mounted on the hood. My Jeep is now heard quite well.
The infrastructure in the populated part of the county has improved
over that time as well, but at least _some_ of the improvement was
from switching radios and antennas (probably mostly the antenna).
I'm running the cheapest 50W 2-meter I could find, and the cheapest
transmit-only TNC I could find (TinyTrak-II).

For an ideal installation I'd drill a hole and mount the ant in the
center of the roof (when my wife's wasn't around!), giving me
additional height and a better antenna pattern in all directions.

Once you get too far into the boonies and there's nobody to hear or
repeat you, APRS won't do you much good. Keep your microphone with
you so you can use the high-powered rig to hit repeaters in case you
get into trouble.

You could also try the APRS satellites. You might not get a lot of
packets in, but one or two packets a day would let people know your
approximate location. From what I've heard you can do this with a
mobile rig quite easily.

> it wrong all this time? Does ten hertz really matter? Should I change?
Comments please.

I think we both made mistakes!   If the radio was really at 10.15(0).00, you
would be creating RF at 10.14(8).200 and 10.14(8).400. I think you meant to
say radio was at 10.15(1).00
[Parenthesis are substitute for bold-facing the digits - can't type numbers
in upper/lower case!.]
    And I think you really meant to say "Does 100 Hz matter?   [10 Hz
would be unnoticable; 100 Hz would definitely put you out of the passband of
high-performance data controllers or soundcard DSP softmodems!]

I made a mistake when I read out the AUDIO frequencies on my soundcard
waterfall display while I was composing the original post at about 3:30 AM
local. The waterfall cursor shows the midpoint between the two tones -- not
the tones themselves. I was in a hurry and noticed it was showing "2200"
meaning my tones at the time were actually 2100 and 2300 which when
subtracted from the LSB supressed carrier freq of 10.151.(5)00 that I was
using yields exactly the same net RF freqs as you were observing.
I carelessly took the 2200 marker to be the HIGHER of the two freqs, not the
center, resulting in the 100 Hz error in my calculations.

Actually, the KAM's mark and space tone filters on HF are switched-capacitor
filters that are individually user-commandable to any arbitrary frequencies,
to accommodate different shifts and receiver passband characteristics.

The traditional tone pair for classic 170-shift RTTY was 2125/2295. The
original 1200-baud packet tone pair based on Bell-202 landline modems was
1200/2200. When narrow-shift 300-baud HF packet was introduced, the high tone
was kept at 2200 and the low tone moved up to 2000 (the source of the error
in my original calculations was that I failed to notice I had tuned my
soundcard softmodem to a CENTER freq of 2200; not a HIGH TONE freq of 2200).

   Some HF radios, especially those equipped with very narrow SSB filters, don't perform very will with data tone pulses so close to the edge of the SSB filter passband (severe phase/group delay problems), so over time, the customary HF tone pairing was moved lower in the audio passband to 1600/1800. This is low enough to hit the flat amplitude response/minimum phase shift part of the SSB passband but still high enough that any AUDIO harmonic distortion of either tone will land far above the upper cutoff of the passband and not be transmitted.

Some other radios have dedicated FSK modes where the audio response of the receive and transmit passbands are shifted upwards to center on 2100 or so in the FSK mode. (It's actually done by automatically engaging the IF-shift passband tuning when the FSK mode is selected). With this type of radio, the orignal tone pairs work very nicely. This feature is especially nice when it allows the bandwidth of a 500-to-800-Hz wide CW filter to be centered on 2100 or so instead of 700 or 800 Hz.

With the KAM (or a soundcard soft modem) it really doesn't matter. You can shift the AUDIO tone freqs to best suit the radio in question, and then offset the RADIO dial freq to result in the same net transmitted frequencies.

Part of the problem is the way the 30-m frequency is constantly being quoted as "10.151.00 LSB" assuming a standard audio tone pair of 1600/1800 is being used.

Since there is an infinite range of possible audio tone/RF dial freq combinations that will yield the same net RF results, we REALLY ought to be saying either "FSK on 10.149.200/10.149.400".

Or do as the commercial types do, and quote the center freq AND shift such as "200Hz shift centered on 10.149.300".

Or do as the soundcard crowd does on PSK31 and quote both an RF freq AND an audio freq to make it unambigous such as "28.131USB + 1500 Hz audio".

In traditional ham systems, it was easier to measure the actual RF frequency of one or the other of the two transmitted tone frequencies (by locking the RTTY "terminal unit" or packet TNC into either constant "MARK" or constant "SPACE"). This gave rise to the convention of specifying the actual mark RF freq as the "operating frequency".

Today, today with the CENTER of the passband of soundcard softmodems being placed on waterfall displays with a mouse click (and especially as we CENTER single-frequency modes like PSK31 or CW), the commercial convention (of specifying center frequency) might be more useful to follow.

Rendered body type: text/plain

Yeh, I misread my dial, too :-)

It is 10.151.07 MHz

The .07 is the amount the VFO is off!

But anyhow my gate is on the right frequncy, even if I don't know
what it is :-)

73 de Ronnie

Subject: [aprssig] Re: Tone freqs on 30M [Was: Being clobbered on 30 m.]

In a message dated 1/23/2002 9:07:35 AM Pacific Standard Time,
gswiebe@mb.sympatico.ca writes:

> The radio dial reads 10.150.00, the Kam tone frequencies are 1600/1800.
> I suspect that 1600/1800 is 'standard' for the Kam and perhaps other
Kantronics TNC's (I
> could be wrong, it would not be the first time). This places the rf
signals at 10.149.200
> and 10.149.400. This is ten hertz different then the numbers quoted below.
It's working as
> well as can be expected for HF packet. I have had numerous brief QSO's.
Have I been doing
> it wrong all this time? Does ten hertz really matter? Should I change?
Comments please.

I think we both made mistakes! If the radio was really at 10.15(0).00, you
would be creating RF at 10.14(8).200 and 10.14(8).400. I think you meant to
say radio was at 10.15(1).00
[Parenthesis are substitute for bold-facing the digits - can't type numbers
in upper/lower case!.]
And I think you really meant to say "Does 100 Hz matter? [10 Hz
would be unnoticable; 100 Hz would definitely put you out of the passband of
high-performance data controllers or soundcard DSP softmodems!]

I made a mistake when I read out the AUDIO frequencies on my soundcard
waterfall display while I was composing the original post at about 3:30 AM
local. The waterfall cursor shows the midpoint between the two tones -- not
the tones themselves. I was in a hurry and noticed it was showing "2200"
meaning my tones at the time were actually 2100 and 2300 which when
subtracted from the LSB supressed carrier freq of 10.151.(5)00 that I was
using yields exactly the same net RF freqs as you were observing.
I carelessly took the 2200 marker to be the HIGHER of the two freqs, not the
center, resulting in the 100 Hz error in my calculations.

Actually, the KAM's mark and space tone filters on HF are switched-capacitor
filters that are individually user-commandable to any arbitrary frequencies,
to accommodate different shifts and receiver passband characteristics.

The traditional tone pair for classic 170-shift RTTY was 2125/2295. The
original 1200-baud packet tone pair based on Bell-202 landline modems was
1200/2200. When narrow-shift 300-baud HF packet was introduced, the high
tone
was kept at 2200 and the low tone moved up to 2000 (the source of the error
in my original calculations was that I failed to notice I had tuned my
soundcard softmodem to a CENTER freq of 2200; not a HIGH TONE freq of
2200).

Some HF radios, especially those equipped with very narrow SSB filters,
don't perform very will with data tone pulses so close to the edge of the
SSB
filter passband (severe phase/group delay problems), so over time, the

customary HF tone pairing was moved lower in the audio passband to 1600/1800.
This is low enough to hit the flat amplitude response/minimum phase shift part of the SSB passband but still high enough that any AUDIO harmonic distortion of either tone will land far above the upper cutoff of the passband and not be transmitted.
Some other radios have dedicated FSK modes where the audio response of the receive and transmit passbands are shifted upwards to center on 2100 or so in the FSK mode. (It's actually done by automatically engaging the IF-shift passband tuning when the FSK mode is selected). With this type of radio, the orignal tone pairs work very nicely. This feature is especially nice when it allows the bandwidth of a 500-to-800-Hz wide CW filter to be centered on 2100 or so instead of 700 or 800 Hz.

With the KAM (or a soundcard soft modem) it really doesn't matter. You can shift the AUDIO tone freqs to best suit the radio in question, and then offset the RADIO dial freq to result in the same net transmitted frequencies.

Part of the problem is the way the 30-m frequency is constantly being quoted as "10.151.00 LSB" assuming a standard audio tone pair of 1600/1800 is being used.
Since there is an infinite range of possible audio tone/RF dial freq combinations that will yield the same net RF results, we REALLY ought to be saying either "FSK on 10.149.200/10.149.400".
Or do as the commercial types do, and quote the center freq AND shift such as "200Hz shift centered on 10.149.300".
Or do as the soundcard crowd does on PSK31 and quote both an RF freq AND an audio freq to make it unambigous such as "28.131USB + 1500 Hz audio".

In traditional ham systems, it was easier to measure the actual RF frequency of one or the other of the two transmitted tone frequencies (by locking the RTTY "terminal unit" or packet TNC into either constant "MARK" or constant "SPACE"). This gave rise to the convention of specifying the actual mark RF freq as the "operating frequency".
Today, today with the CENTER of the passband of soundcard softmodems being placed on waterfall displays with a mouse click (and especially as we CENTER single-frequency modes like PSK31 or CW), the commercial convention (of specifying center frequency) might be more useful to follow.

675. [aprssig] D700 "Emergency" Bug??? The Plot Thickens...

From: "Stephen M. King" <frastephen@home.com>
Date: Wed, 23 Jan 2002 14:26:14 -0500
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-58747-2002.01.23-13.56.37--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

BACKGROUND: A few days ago a station using a Tiny Track II was sending a position packet with the Message Code set to "Emergency!". This tripped the alarm in my D700 -- which then promptly powered-down on its own about 30 seconds after the alarm. This happened repeatedly.

RESPONSES FROM THE SIG: Several SIG members tried to duplicate this (on an unused simplex frequency other than 144.39!) using D7's and D700's .... no problems were observed.

MY OBSERVATIONS: I also tried it with a D7 -- again, no problems were observed. on my D700 which had powered-down repeatedly -- but with packets from a Tiny Track II.
I noticed that when I received the test "EMERGENCY" packets from the D7 that the alarm screen on the D700 contained the D7's station info (position, status text, etc.) along with the calculated distance and heading. BUT, when the Tiny Trak II "Emergency!" packets were received on the D700 this station information was not displayed on the Alarm Screen. When I hit the "DETAILS" button the info came up .... then shortly thereafter the radio powered-down.

QUESTION: Could someone duplicate this experiment (again, on a simplex frequency other than 144.39) with a Tiny Trak II and a D700 or D7? If there is someone in the Philadelphia area with a Tiny Trak II I would be willing to set up a test.

If there is an incompatibility between these two devices, it might be worth figuring out what the problem is ...

FWIW, I noticed in the TT II documentation that you can set up two configurations that are switch-selectable. If many folks are setting up the alternate configuration as an "Emergency!" beacon I am surpised that there have not been more false alarms ... If folks are doing this I think it would be helpful to include in the comment field where they are listening for replies to their distress call....

Thanks for the bandwidth!

Peace and 73,
Stephen

Timex actually has a watch with a BUILT-IN GPS. Unfortunately, it doesn't have an NMEA 0183 serial output; else it would be the ultimate companion for a THD7 handheld!

677. [aprssig] Cool APRS Project Update

From: <gavingroce@yahoo.com>
Date: Wed, 23 Jan 2002 14:10:04 -0600
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-58759-2002.01.23-14.40.19--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Just to let you know I now have APRS dos booting on the symbol PPT-4330 that
I got off of ebay...
http://www.qsl.net/ke4tvv/upd/5.jpg
http://www.qsl.net/ke4tvv/upd/4.jpg
http://www.qsl.net/ke4tvv/upd/3.jpg
http://www.qsl.net/ke4tvv/upd/2.jpg
http://www.qsl.net/ke4tvv/upd/1.jpg

Now it is setup to boot into aprs for dos... I need good maps for middle
tennessee :(can't find them...
I do have SA 5.0 can I use them?

I have a 10 mb ata flash card in it now and it is useing the ROM-DOS that it
has on it's 2MB flash...

Found a guy selling 64MB ata flash cards for 20 bucks so I am going to try
and put a stripped down version of 98 on it useing the demo version of
98lite (to bad it only strips it down to about 50 megs)...

My TNC should be here soon and I will hook it up.

If you would like to get a pen pad I can send you the email address of the
guy who has quite a few.

The only thing I need help on is finding a connector for the serial port.
http://www.qsl.net/ke4tvv/pdt2.jpg
I do have the pin-outs thanks to symbol :) I just don't want to hack it up
if i don't need to...

It only has one serial port and I need a low cost small way of getting
around that so I can hook the GPS and TNC up to it...

does anyone know of a latop PC serial card that has dos drivers? or a low
cost HSP device?

Lookout! I will be backpacking with this soon :)

http://www.qsl.net/ke4tvv/pdt.html

thanks,

ke4tvv

Rendered body type: text/plain

Last night I was extensively searching the web for quick
summaries/descriptions of APRS. I came across dozens of copies of (and
quotes from) Bob's DOSaprs documents that state that 145.79 is the frequency
to use. Many of these so-called APRS introduction and information sites
haven't been updated in 1 or 2 years and are citing versions of Bob's
documents from 1999 or earlier.

Google for "145.79 MHz" and see how many references are still out there (in
the present tense -- not as past history)!

After going to the trouble of composing the message (below) and working out the frequencies using my ancient Hewlett=Packard 21 reverse polish calculator I screwed things up with two typos as several have pointed out. The rig dial reads 10.151.00, NOT 10.150.00 and the error is 100 hz NOT 10. AAARGH!!! Seniors moment!!! And I agree with the originator of this thread that we should quote RF center frequencies, not dial reading.

BTW, I use a 500 hz filter and tweak the IF shift control so that the end LED's on the Kam are of equal intensety when receiving band noise. I don't know if it helps but it doesn't hurt. HF packet needs all the help it can get.

Once more 73 from the Canadian sub-arctic...Glenn...VE4GN

Obviously a biased web page. You can find people disgrunted on the web about anything, from the damper wires in Trinitron monitors to daytime running lights

> Many small highway
>burgs enhance their general funds with unfair use of speed traps (and
>collect fines at roadside!). Instead of a discussion about conspiracy, how
>about a discussion about due process of law.

Again, you've changed the subject. Many drivers I know consider a speed trap to be a lone officer sitting by the side of the road (in plain view) with a radar gun...

Collecting fines at the time of citation is a common practice and one that has been held up by the courts. BTW, if you don't pay the fine, you are usually taken to a JP and given an ajudication within hours. Paying the fine allows you to go on your way without being detained. Game Wardens do this in most Midwestern States, too. Mainly because of people who leave a jurisdiction and never return for their court appearance.

>A speed trap can certainly be considered a "Road Hazard" and as such might
>be appropriately used as a temporary object on the APRS map. Of course Ham
>radio operators are usually too busy talking on the radio to drive
>excessively fast. Right?

Again, you can try and justify your viewpoint anyway you want, it doesn't make it ethical. I suppose you could call a sting operation where police set up a pawn shop and buy stolen goods from off the street an entrapment scheme. Many lawyers have used that argument...

73,

Mark

I might be able to get to it later in the week.  I have a few TT-II's
and a TNC hooked up to Xastir to capture with.  No D7A's though.

What are the test conditions, just setting the message to emergency
on an unused frequency?  Anything else?

Great!

I think that is sufficient.  Anybody else have any thoughts on that?

I can capture "Emergency" packets from a D7 and D700...

Thanks!
Peace and 73,
Stephen

Yes my APRSdos docs are avaialble on my site and what you are seeing are 8
years worth of old copies out there... Mine (always current) are on

http://www.ew.usna.edu/~bruninga/docs/APRS-docs/

Notice the mixed case....

Are you all talking about using the emergency symbol (secondary symbol !) or
the emergency setting for MIC-E. I have yet to run my TTII in MIC-E mode.
Does it work well? I seem to recall some programs and Kenwoods would not
decode it.
BTW, if I go up to 10,000 feet and send EMERGENCY with 50 watts and WIDE7-7
it sounds like all the Kenwoods in 15 states will shut down!
```

It might be better to capture the exact packets via the logging
functions on APRS software.  Capture both the D7A and the TT-II
packets, then compare the two against each other and against the
spec.  Snag one emergency packet from each and post it to the aprspec
mailing list.  Someone there should be able to tell what the problem
might be, and quickly.

does anyone know how big of a UPS system i would need to power a "basic"
APRS setup.. this would cover a computer, wireless internet modem (no digis
round here), and a 2m rig, with power supply (20a)

i see power supplies ranging from 500Va to 40KVa  how big would i need?

>

Off topic with this, but in most states, if not all, the state law limits
the amount of funds a city can take in with fines/fees to around 20%, in
other words, only 20% of the cities total budget can come from speeding
tickets, bulding fees ect.   if the city collects more than the 20% it has
to either pay a fine to the state, or refund the outstanding % to the
cities taxpayers (i've seen some cities do this in the form of "no tax
days" ect.)

so the point that many small towns use the money to pad there pockets is,
well, false

There was also a fairly large article in the local paper today (the
Worcester
Star Telegram) about the sat. Probably 1/4 page in the technology
section,
though not on the front of the section. Including a good size drawing.

VERY positive article.

Mike

I don't have the details here in front of me, but what happens, is as positions come into the D700 via
APRS, the waypoints get plotted on the Streetpilot III. You can then see them on the map! You can
route to them etc.

Without the GPS and D700 in front of me, I forget how to turn the D700 to GPS function on. I don't even
remember if it's a Streetpilot, D700 or both option. Maybe someone else can fill in the blanks here.

The only downside, is that they don't go away by themselves. Once they are in the GPS they stay there
unless you manually delete them.

The way I handle this in the GPS is all the waypoints I create manually, I use something different than
the default "dot" icon. Such as a house or something. When the D700 creates waypoints, it uses the
default "dot". Every so often, I then go into the GPS, select a D700 created waypoint, and delete it.
There is a menu choice on delete that asks if you want to delete all waypoints of this type, and I say

```
"yes".  This then deletes all my D700 created Icons and leaves all the rest.

I have a III and a d700.  Data from gps goes into the radio fine.  In
your post u mentioned uploading waypoints?  Why and how do I want to do
that?  I know this didn't come out right so lets try agn.  I have a III
and a d700.  What is neat and exciting about this combo?

         Not exactly -- they pad their budget by that 20%.  Actually, I
believe it's 30% in Texas.  Either way, if they count on 20% of, say, 20
million dollars, that's what?  Maybe 4 million the taxpayers of that town
don't have to come up with.

         So -- do you think they count on getting that revenue from traffic
tickets?  And, if they do, what happens towards the end of the fiscal year
when they still don't have all of it?

The biggest variable in this equation is how many minutes, hours, days or
weeks do you want your system to run without an external power feed?

Many basic UPS systems just provide enough power to wait 30 seconds then
power the system down properly - others can provide many hours of ongoing
operation.

Basic equation, bigger the capacity the longer it will run before shutting
down.

To: gavingroce@yahoo.com
Subject: case info

I'm not sure what you mean?
I suspect you want a small, roof-mountable gps/antenna module unit with a
9-pin serial connector that, when you apply power, outputs nmea position
information to whatever device you have attached (like a laptop, for
example).
We have these in stock. Power is supplied to the module via a cigarette
lighter adapter which is included. Price is US$89 plus $10 shipping. We
accept VISA

You also might be talking about an otterbox case. All of ours have windows.

Call to order 1-888-444-0302

702. [aprssig] PCsat SAR system activated

From: Bob Bruninga <bruninga@usna.edu>
Date: Thu, 24 Jan 2002 13:57:46 -0500 (EST)
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-58935-2002.01.24-13.28.18--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

PCsat SAR mission Activated.

First the CAVEAT: *** THis is HAM RADIO **** and should never, ever, be considered even as the slightest substitute for the official SAR, EPRB and other commercial technologies for emergency reporting of remote travelers.
****

Today at 1815z we activated the experimental PCsat SAR capability. THis "experimental" capability allows any remote traveler with only the TH-D7 HT in his pocket or D700 mobile rig (or other Mic-E compatible APRS system) anywhere on the planet to send up an Emergency or Priority message for store-and-forward via PCsat to the rest of the world.

Normally PCsat relays communications only within its footprint, so normal messages only reach the worldwide APRS internet linked system if there is a downlink SATgate in the footprint. ALthough we have such stations around the world, including SANAE on Antarctica, there are vast areas with no one monitoring the downlink.

To test this capability, we transmitted a single "test/priority" packet and it was captured by the satellite and will be replayed once every 5 minutes on the 144.39 downlink over the USA. There it will be picked up by the continent-wide APRS system and be visible to all users. Look for the packet from WB4APR-8, saying in part... "Test of emerg/priority system."

Remote travelers desiring access to this system let us know...

It was implemented within the KPC-9612+ TNC by a slight modification to the MHEARD log that is found in all TNC's. The TNC captures only the special packets to its AHEARD log and then has a setting called ABEACON that tells the TNC how often to dump its AHEARD log.. Remember, PCsat has no computer or operational program on board. It is only a flying TNC...

Looks like a typo -- I think it is $189 not $89! I think this is the Tri-M Systems "Smart Skymaster" . It is a complete patch antenna AND receiver in a package about the size of a patch antenna alone. It hardmounts through a single 3/4" hole in the car's body sheetmetal. You feed 5VDC into the unit and RS-232 NMEA-0183 data comes out. I am currently using one of these with my D700. There is a pic of it on my website at:
http://members.sol.com/wa8lmf/aprs

If they are really selling it for 89, then they are underselling the US distributer of this same ant/receiver by $100! I'll order a bunch at that price.

Rendered body type: text/plain

Sorry about off topic but....

Speed traps are a special hatred of mine. Texas has many small towns that extend their city limits well past the last evidence of a town or city along a state highway and hold the speed limit artificially low to entrap motorist that are driving at or near the normal speed limit. I have been stopped twice in this type of trap the past three years while driving well over a hundred thousand miles without any other tickets. With all of the electronic toys I have had, I have never owned a radar detector because I don't need one.

I beat one by asking for a jury trial (I would have won the case on the merits had it gone to trial) in a town of eight hundred people and a very active police force. The other situation was while storm spotting during a tornado WARNING and not noticing the city limit or speed limit signs. In both cases I received a ticket for eleven miles over which was about right. I took the easy way out on the second ticket because of the mileage I would have had to travel to defend myself...

Texas has laws that limit towns to the amount of fine money they may keep, but it does not restrict the court costs at fifty bucks a pop... A lot of the money never gets reported; at least three towns were bankrupted when the state caught them at it... It is legalized highway robbery... THE SORRY TOWNS DO PAD THEIR POCKETS and some of the official's pockets also...

Soapbox off...

Joe Dorn, W5VEX, Belton, Texas

>

Off topic with this, but in most states, if not all, the state law limits the amount of funds a city can take in with fines/fees to around 20%, in other words, only 20% of the cities total budget can come from speeding tickets, bulding fees ect.   if the city collects more than the 20% it has to either pay a fine to the state, or refund the outstanding % to the cities taxpayers (i've seen some cities do this in the form of "no tax days" ect.)

so the point that many small towns use the money to pad there pockets is, well, false

who'd have known life could be so simple, yet so complex.

Everybody,
AHubIN, and AHubSAT will be down for the next few days. (Until Sunday) There are many reasons, but the main two, are because I'll be doing some hardware upgrading, and having a few little ISP problems that I need to get worked out with them. If you try to use AHubIN, or AHubSAT, you will be re-directed to AHubWest. Sorry for any inconvience that this may cause.

"Basic equation, bigger the capacity the longer it will run before shutting
down."

I beg to differ. Runtime is a function of battery capacity, not UPS
capacity. The battery configuration must be matched to the desired runtime,
not the UPS capacity.

Joe,
AFAIK, FindU cannot decode raw Mic-E packets. It must rely on conversion
by IGATES, Hubs or Servers. These conversions are then placed on the APRS
IS feed. Some conversions are simply in error, or may not include all of
the data available in the raw Mic-E packet.

The incorrect or missing data is usually not the fault of the Kenwoods,
TinyTrack etc, but is usually the fault of the applications that provide
the conversions to the APRS IS and ultimately to FindU.

APRS packets (all of them) are unconnected information packets.
Beacons are unconnected information packets.

So if the node is configured to allow digipeating beacons, it should also
digipeat APRS packets.  The would hold true unless the node has additionally
been configured to only pass packets with a destination of "BEACON" or
similar, or has been configured to reject packets from stations that have
been identified as running APRS.  Also, the UNPROTO path would have to be
via the node's name or callsign.

Depends on the current draw. VA is (very roughly) watts, so figure out how
many watts your equipment draws. Then ask yourself how much time you need
at that power and use that to size the UPS.

True, but in today's off-the-shelf UPS systems, you don't get to choose.
The systems are sized to provide a short (10 minute?) run time at max
capacity, and that's the (k)VA number you see on the unit. If you aren't
running at that capacity, you get more run time. In order to get a system
that lets you add run time, you have to start with high-end UPS systems and
go up.

```
Iv got an extra walkabout hammerhead P133 that i replaced with a new laptop. which has the following in
it:
Intel Pentium 133 MHz, 64 MB RAM (On-Board)
4 GB IDE HDD, NO CD-ROM, NO 3.5" Floppy Drive
2 PCMCIA Style II Slots, 4MB IR Port
640x480 24-Bit compatible Monochrome LCD Screen (Backlit)
Screen contrast and brightness is controlled through Windows software utility
High-resolution Tablet Screen (Use Stylus as Mouse - Handwriting recognition)
Unit is enclosed within a protective soft-case with handle (Designed to be left on during use)
also iv got it mounted in the vehicle docking unit.. which here is a link to what it looks like:
http://www.walkabout-comp.com/Products/vehicle.htm
it has a battery in it.. which i get about 2 hours outa it...  but most of the time it was powerd from
my car then when the car was off i put it to sleep and it was on the battery overnight..

im asking $350 or best offer..

How about a couple big gel-cells or sealed deep-cycle batteries floated
across the power supply and a cheap laptop (200-300Mhz)??

One can likely find a laptop, batteries, cables (and a big diode) for a
fair bit less than a new 2Kva UPS.

I dunno. I was out pricing deep cycle batteries today, and they were in the $80+ range, and you still need something to charge 'em with. If you don't mind not new, check ebay - I found a whole lot of APC 650VA UPSs going for under $100, and if you can get up to $250 you can probably score a 1400 or 2000.

Granted, if you can run everything from 12v, you could make things simpler. You wouldn't need the power supply to run the radio, but you still need something to charge the battery.

(Anybody know of a source for new 12v gel cells in the 50 AH range? Email privately, please.)

At 02:28 PM 1/24/02, Jacques Voisin wrote:

> What does this have to do with APRS?

It has nothing to do with APRS. Unfortunately, someone suggested we start an APRS warning net of active police operations (speed checkpoints). As I have stated many times, Amateur Radio and APRS are not the appropriate forums for waging vendettas (against individuals, corporations, and I'll add government agencies to that too). Yes, there are law enforcement agencies that play fast and loose with their duties; but let's be honest, most people have radar detectors and CB's to flaunt the law, and not to avoid the few municipal or state agencies that abuse their power. Two wrongs do not make a right. I can document thousands of IRS abuses, but that does not give me the right to misreport my income and cheat on my taxes.

I never want to see newspaper headlines reading, "County Prosecutor accuses local ham radio operators of subverting police duties - Indictments to follow."

73,

Mark
KC7BXS

PS: Stan, I'm trying to keep this discussion within the bounds of APRS.

Hi Quentin,

> Does anyone know if you can pass unconnected aprs messages
> via conventional packet nodes ...

Absolutely. APRS messages are unconnected by nature.

Here in southern Manitoba we have a provincial network of old 'theNet 1.22' node stacks all on a 9600 baud backbone. I've had people digi APRS frames over 4 or 5 of these nodes to get onto our internet gateway frequency, on which we run the 'VE4UMR' TNOS internet gateway and a NOSaprs APRS igate to intercept any APRS frames (it's a zoo channel, APRS, FBB forwarding, TCP/IP, etc).

The only thing you have to be certain of, is that the L2 digipeating flag is enabled on the node parameters.

> the town of along I do it here in like beacons pass
> thru the network.

It's funny you mention that. I don't know if you recall, but there is a conventional packet node on 145.01 (was anyways last I checked near Fargo, North Dakota - the Barnsville node). I was surprised to see the following at findu.com one day :

Click on this -> http://map.findu.com/mnbarn

I wonder if this is the same node. I'm guessing that maybe they have upgraded the node software and burned an APRS type beacon text into their eproms. I don't know, but I'd be like to hear from anyone who maybe knows about it.

That to me is a very nice use for APRS in the sense that you know when the last time a node was heard, giving one a good idea of the status of the conventional node network, etc.

Glen, your need will be determined by several factors:
1.) how much power do you need the UPS to supply in event of mains failure.
2.) how long do you need the UPS to supply power to your equipment.
3.) How big is your wallet.

There are some additional factors that may come into play:
Do you need UPS management capability?
Can you afford the UPS replacement batteries? (You must replace them approx. every 3 years.)

UPS systems are varied in size, management capability, reliability and price. There are some good UPS systems on the market and there is some junk .
Some UPS systems are able to monitor environment conditions/mains condition and run scheduled self-tests which are useful in letting you know when the UPS batteries are worn out.
Some UPS systems are able (with the proper software installed) to shut down your computer "gracefully" before the UPS batteries are

exhausted.

ex.) I use two APC Smart-UPS 700va UPS systems to power my
Digi/WX/Igate.
One UPS powers the computer, monitor, and network hardware.
The other UPS powers the radio, tnc, wx station, and power supply.
Yes, I could have bought a Smart-UPS 1400va unit. If I wanted
to end up broke. The replacement batteries were $112 USD a piece
and the 1400 uses two of them.
The batteries for the 700 are $26 USD available locally
(I still need two per UPS).

You might find a UPS available used (This is how I got mine) for much
less than brand new. If so you need to be sure it will FULLY charge
the batteries. Also plan on replacing the existing batteries as they
are most likely worn out.

Good luck in your quest.

I was wondering about a backup system for a APRS weather station I am
thinking about putting up. Could you hook up a external deep cycle battery
to the UPS, to extend the run time of the UPS?

It looked like from the original post that a power supply was already on
hand. (at least before it took it down to move) Had a couple 125Ah
batteries floated across the PS (with isolator) feeding a pair of
busses. All the radio gear and emergency lighting for the shack fed off
them. The desktop computers were on a couple 1200VA UPS units with auto
shutdown software loaded. I had 2 laptops on the 12V busses.

Works like a champ when power. I picked up the 125Ah batteries at a

"Batteries Plus" store in Colorado Springs. I know that with the number of telco/internet companies going under there should be a lot of the big telco plants floating around on the surplus market. All the ones I worked with were 48V plants, but with some restrapping you could have 4 12V strings in parallel.

My concern with buying used UPS units is that you don't know how old the batteries are. If you have to replace the batteries you can easily double the price of the unit. I'd rather have a good Trace Engineering inverter hanging off a big battery bank to run my gear than a consumer/small-biz grade UPS. I guess it comes from the telco background.

Menu 3-3 Waypoint allows you to set up whether or not the $GPWPL waypoint data format is sent to your GPS upon reception of position data.

See TM-D700A Specialized Operation Manual Page 15.

The radio takes position data, and turns it into an NMEA compatible reporting format. Any GPS that can receive waypoint in this format can show you the icons on the GPS screen. There are limitations on waypoint name lengths, so some truncation does occur.

Some GPS receivers need to have their IO set up to allow NMEA In/Out (my Garmin II+ calls this mode NMEA/NMEA).

Read your owner's manual, both for the GPS and the radio! It's amazing how
much information the manufacturers put in those little books! Yeah, I
know... it's no fun reading the manual!

It's worth checking with a local battery supplier and not being too
specific about what capacity you need. A local battery supplier has really
good deals on one specific size of 12V Gel Cells. They bring in a large
quantity of them per month for a local horse trailer manufacturer who uses
them for the trailer brake breakaway circuit. (I imagine they're a one time
use in that application.) Anyway, they sell those much cheaper than some
similar size batteries that they carry because they get a quantity discount
and pass it along.

[Off topic] If you have kids with one of those electric ride in jeeps they
carry replacement batteries at about half the price of the toy stores...
[/off topic]

Don't you wish you had been around when I posted this at the end of 2000
(and been within a couple hundred miles of LA) !
A lot of them went to APRS and repeaters (and I think a few were used in
the Baker to Vegas as well as the Tournament of Roses Parade.

This offer is NO LONGER GOOD. The batteries were given away over a year
ago. If anyone writes wanting them, I will ignore the message.

>I have a quantity of large Gel Cel batteries to give away.

```
Or, you can do what I did. I had an older (1997) APC BackUps 420
which had a bad battery after serving me well for 4 years. Didn't
have the correct replacement battery on-hand and wanted to make something
that would give me extended run time to keep the APRS setup running.
SO I took a 20A gel cell and connected it to the UPS charging output.
I did this by following the battery leads back to the point of connection
on the board and de-soldered them. Then soldered in their place a set of
leads with 40A Anderson Power Pole connectors on them to the board. My 20A
battery (about 8x8x6") is now connected and charged by the UPS. and can be
swapped out easily by just disconnecting at the Power Pole connectors and
plugging in another battery.

I run tested this on the battery only for almost 3 full days powering
my TM-V7A on low power (5 Watts) and a KPC-3. By this time the battery
voltage
was down to 12.4V and I put it back on charge. The TNC was set to beacon
```

```
every
30 minutes, no computer was connected to the system. Run time would of
course
been much shorter if I had been holding a QSO or actively using APRS to
uplink
information or sending messages to someone.

Look around at Hamfests and computer shows for old UPSs, then browse around
until you find someone selling the large UPS batteries for cheap. I recently
bought a new 80A gel cell battery for $30 and will be replacing the 20A
battery
with the 80A battery.

Bob D.
N2IPH

On Thu, 24 Jan 2002, Mark Fellhauer wrote:

> It has nothing to do with APRS.   Unfortunately, someone suggested we start
> an APRS warning net of active police operations (speed checkpoints).

To my recollection, the origianl person suggested that more of use APRS
objects for marking things that would be helpful to our fellow
travelers/commuters such as "speedtraps" and trafic jams, etc. The topic
was how to place OBJECTS on APRS. One person then has spun that off as a
crusade for his opinion about speedtraps... and it goes on and on.

I answered the original email about how to put objects on Maps easily
while mobile
and pointed out the additional APRS features for SIGNPOSTS Icons in APRS
that are not only objects, but are SIGNS that can have a speed posted on
the ICON for showing the speed of traffic past a point. AN ideal APRS
application for alerting drivers of slowdowns and traffic problems.

THe way I saw it, the topic was OBJECTS, not speedtraps...

Rendered body type: text/plain

```
Here is an idea for long range tracking...

It would have worked well on something like the olympic tourch or other
such far ranging and high interest device...

* Take a D700 and program it with the 5 or so uplink channels of the
existing digipeating satellites.  Set the position rate to once every
minute.  Hook a transistor or whatever between the TNC's PTT lead and the
UP button.

Then you get a single posit packet via each satelltie once every 5
minutes, about the minimum to assure you get it at least once per
satellite.  With 5 sats and 5 passes per day each, thats 25 hits per
day...  or about one per hour on average (but they are not evenly spaced
by any means)...  And you neeed to be tracking the satellites to receive
the posits.  To my konwledge we only have permanent IGates listening to
PCsat and ISS only at this point....

We can always use more...

No, this is not for everybody, but it might be a simple solution for that
special one-time need somewhere...  Common sense would dictate the
conditions under which this might be appropriate...

```
> Unfortunately, someone suggested we start an APRS warning
> net of active police operations (speed checkpoints).
```

{sigh}

That someone was me. As an example. If folks read the follow-up (see below), they would have seen that all I was really interested in was useful objects for travelers and that cell phones would soon have this capacity...

"

> Why would you be willing to aide someone who is
> driving at risk?

Let's not get into that discussion on the list. My definition of 'at risk' is probably greatly different than yours.

Forget I said 'speed trap'. If it makes you feel better, let's say 'cheapest gas prices in town'. No, that'll upset the 'nothing even vaguely for-profit related on the radio crowd' (if though it's a regular drive-time topic on 2M repeaters everywhere).

How about 'hot chick sun bathing in front yard'? Who could possibly be against that?

The point was, the ability to easily put objects into the APRS stream (search of the list for APRSdata.exe for examples) is rather nifty and, hey, look, there are commercial companies doing it with cell phones and GPSs.

"

During drive time, speed enforcement is a common topic of discussion on 2M repeaters. When CB radio was first making it big, several law enforcement agencies in many jurisdictions took CB users to court for 'aiding and abetting' and 'evading arrest' because they were telling other users where speed traps and increased enforcement were taking place.

In every single case (that wasn't thrown out to begin with), the judge ruled that simply reporting a speed trap does not meet the legal criteria of aiding and abetting or evading arrest. Further, the user's first amendment rights were paramount.

So, the folks who say this is borderline illegal are just simply wrong.

I apologize to the list for using such an inflammatory example. I should have known about the hair trigger this list has and thought long and hard about my example.

From now on, I'll use 'cute, fluffy bunny sighting' if I want to talk about APRS objects that might be useful to travelers. Assuming, of course, no one has any objections to cute, fluffy bunnies as they relate to APRS travelers.

(If you do have any cute, fluffy bunny objections, please contact me off the list. Thanks.)

Matt (k4mls)

742. [aprssig] Win APRS web server? Being able to query it and sow a map on the local Lan

From: "Brian Webster" <radiowebst@yahoo.com>
Date: Fri, 25 Jan 2002 11:11:25 -0500
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-59129-2002.01.25-10.37.24--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Is there an easy way to run a query (using a web browser) against my local WINAPRS web server and have it come back with a map without having to connect to map blast? I was thinking of making a link/URL shortcut on my wife's computer for her to run against my APRS station on the LAN and give her a map in the web browser to see how close to home I am. I know it works if you have outside connectivity but I don't have a full time net connection.

Brian, N2KGC

Well I am waiting for the parts to arrive so I can finsish putting aprs on the pen pan and I have got to thinking about maps...

If I go the aprs dos way mis there anyway I can use the SA5 maps that I have? Or do I have to stick to windoze for that?

Hello Brian.

This is exactly why I got the idea for Watcher. So my wife would know I'm getting close to home from work - so she has a little advanced warning to close the EBAY windows..

It doesn't have local maps yet but will soon.

http://www.jnos.org/projects/watcher/

```
Trying to configure my TTII but get a WRITE FAILED when
I try to write.   When I select read configuration, I
get most of the info but the BEACON TEXT is garbage.

Have not been able to get any response from the vendor.
Anyone have any idea what the problem might be.

Thanks.

I've been experiencing that problem with a friend's TinyTrak-II that
I just built for him.  It sometimes takes a few power cycles of the
TT-II and a few tries with the program before I can get a good read.
After that it'll usually program ok.  Sometimes trying a different
machine or cable works.

We built ours differently so that we need adapters and/or cables to
connect to the computer, but it connects directly to a GPS-to-PC
cable.

I've had very little trouble with any of my TT-1's or TT-2's.  Just
had a bit of trouble lately with this new one that my friend has.
We've been able to work through it each time we've had to do it
though.  Most recent was Wednesday night.

I caught a packet from Maine yesterday.   That's coast to coast (Redmond, Wa) which
is about double the 1500 miles.

I've had a similar problem. I think its to do with the amount of RAM
available in the TTII. If you remove some of the settings in the alternative
setting ares (like the other beacon text) and then do the write it works.#

Mark

Great,

I just took a pass of UO-22 and what we really need is for someone to add IGating to WISP or other PACSAT software so that any UI packets that show up in the downlink are IGated into the APRS internet system for worldwide live distribution.

I watch UO-22 passes and the PACSAT PROTOCOL user list is almost always empty. The stations that do log on at the beginning of a pass are usually fully automatic stations that are only downloading the directory and have no other traffic. It seems a waste to have these fully automatic tracking and tuning stations not doing much else. When they could just as easy be feeding any UI digipeated packets into the internet.. Then we could add UO-22 to the list of UI digipeating satellites available for live digital QSO's and Email from mobiles and HT's...

I see several people sending APRS Emails up via PCsat, but they could just as easily do this via UO-22 if someone was monitoring the downlink and feeding the packets into the internet... THe satellite doesnt matter. It is just digipeating... PCsat, ISS, UO-22 and soon Sapphire.

See ASTARS web page below...

You can do this sort of thing with Xastir. There's a button that
enables auto-creation of an image from the map screen every five
minutes or so. I have Apache running on my Linux box at home that
then allows my wife to connect with her browser to see the map. I
set Xastir up to track my Jeep. I only had to create a symlink from
the Apache directory over to where the image is created. Works well.

Sorry, no Winders versions of Xastir. It only runs on Solaris,
FreeBSD, Linux, and Mac OS X so far.

Hi Brian
               You could use a kludge method.
First you would install IrfanView on your WinAPRS machine.
IrfanView is a free Graphic viewer that is fantastic. It does just
about everything you would want a graphic viewer to do.
Which includes the ability to automatically on a user programable
interval take a screen shot. Then save this screen shot in a user
programable directory. Of course this screen shot would be of your
WinAPRS map. Then a Web browser could be used to access this
local directory on your lan.
You can download IrfanView at the following URL.

http://www.ryansimmons.com/users/irfanview/english.htm

In fact, more users have access to Netscape than IE. All Windows users
can install Netscape, as can all Mac users. So you can freely obtain
Netscape and install it on your computer.

Netscape is also available for most UNIX systems, which IE is not.

Perhaps the FCC does not want to encourage a company which
was found guilty of illegal business practices.

> Any book on HTML (more precisely, HTTP) will tell you that there are

I suggest consulting the specification (RFC2616,
ftp://ftp.isi.edu/in-notes/rfc2616.txt) rather than some book:

3.2.1 General Syntax

   URIs in HTTP can be represented in absolute form or relative to some
   known base URI [11], depending upon the context of their use. The two
   forms are differentiated by the fact that absolute URIs always begin
   with a scheme name followed by a colon. For definitive information on
   URL syntax and semantics, see "Uniform Resource Identifiers (URI):
   Generic Syntax and Semantics," RFC 2396 [42] (which replaces RFCs
   1738 [4] and RFC 1808 [11]). This specification adopts the
   definitions of "URI-reference", "absoluteURI", "relativeURI", "port",
   "host","abs_path", "rel_path", and "authority" from that
   specification.

   The HTTP protocol does not place any a priori limit on the length of
   a URI. Servers MUST be able to handle the URI of any resource they
   serve, and SHOULD be able to handle URIs of unbounded length if they
   provide GET-based forms that could generate such URIs. A server
   SHOULD return 414 (Request-URI Too Long) status if a URI is longer
   than the server can handle (see section 10.4.15).

      Note: Servers ought to be cautious about depending on URI lengths
      above 255 bytes, because some older client or proxy
      implementations might not properly support these lengths.

The specification specifically states that there is no maximum
length for a URI. There is only an implementation note, which
is not a requirement.

IE is available on Solaris and I have little doubt but what it's
running on Linux - through probably not released to the public.

Nothing Hamish said implied you had to. Nor said it directly.

I cannot install IE on the computers I own without first installing an operating system I've established is not capable of remaining stable in the use states I place it in. Linux, however, is. Thus, I use Linux for my purposes.

Please don't demand that everyone write websites that are specific for IE, or for that matter, Netscape. If people would write good, standards based code without superflous "extensions," and test it with several disparate browsers, more pages would just work right all the time.

... which doesn't count really. IE is available on HP-UX too
but I've heard it's so slow that it's unusable.

Rendered body type: text/plain

This (snip below) is not true.

IE is available for HP-UX and Solaris.
http://www.microsoft.com/unix/ie/default.asp

Since May 27. 2000, it has also been available for the Mac.
http://www.microsoft.com/mac/products/ie/ie_default.asp

I'm not saying that these are the best software packages to use on these platforms, just that they ARE available. Outlook Express (the perpetuator of all things SPAM) is also available for download but I certainly wouldn't want to pollute my UNIX or Mac machine with it.

-----snip-----
In fact, more users have access to Netscape than IE. All Windows users can install Netscape, as can all Mac users. So you can freely obtain Netscape and install it on your computer.

Netscape is also available for most UNIX systems, which IE is not.

>are just simply wrong.
```

Every single case thrown out?   So you've documented all court cases in all 50 states in regards to this? How about the guy in Vermont or the people in Illinois who were using signs instead of CB radios?   And these people were not charged with the crime you state.   I'm not saying it's borderline illegal, I'm saying it's textbook law illegal.   And again, someone here has made the mistake of confusing freedom of speech (first amendment) in regards to the use of RF transmitters.   There is no 1st Amendment protection afforded in the U.S. to amplified or transmitted speech.   Amateur Radio Operators should know that by now.

In Illinois - Obstruction of Justice is defined by the legislature and the courts as: The intent to prevent the apprehension or interfere with the prosecution of someone engaged in a criminal activity. It is a class 4 felony.

What may have happened in courts 25 years ago really has little bearing on today, especially when you're talking about monitoring and reporting the exact location of police officers and resources in real time over the Internet.   Speaking of which, I can't find the specific statute, but also in Illinois there is a criminal statute that addresses the surveillance of police.   A female friend of mine filed a complaint against the Park Ridge, IL police, detailing times, locations, and dates of police activity (over a period of several weeks) she thought constituted abuse of police power.   She was rewarded with a letter from the Cook County Prosecutor's Office, citing the state statute, and ordering her to cease and desist with her "illegal" surveillance of the Park Ridge Police Department.   Although she probably could have pressed the matter, she instead framed the letter, hung it on a wall, and decided not to tilt at that windmill anymore. A wise choice.

73,

Mark
KC7BXS

What was Bill Cheek's crime anyway?

Unfortunately, the example given was speed traps.   I bit my tounge and waited a day or two before I weighed in on the subject, because I was a afraid someone might actually think it was a good idea and start doing it.

BTW, here in Sioux Falls the local PD updates the location and status of every patrol car in city via MDT at least six times an hour.

I would be an IDIOT if I extracted that data (in an automated or even non-automated fashion) and posted it (in real time) to the Internet or a web site OR transmitted that data to other APRS users.   If I did, I would probably be known as the Abner Louima of Sioux Falls...   ;)

  Subject: [aprssig] APRS + Off road

  Hi everyone,

  Has anyone experienced using APRS in off road trips? Interest on this topic has arrised on a local off
 road group as many of their SUV's are equiped with a GPS, VHF equipment, and in some cases also HF and
laptop for moving map. Any comments, tips or websites are welcome as this would be a great oportunity to
 expand the APRS community in our country.

Rendered body type: text/plain

When I told the guys I work with that I have a radio I use to talk to
space men....they looked at me a little funny but let it pass....
Then when I told them some guy in the U s of eh launched a battery
operated toolbox into space and left a tape measure sticking out....and
I can use my radio to contact stations all over north america......then
they started sitting at the other table during lunch.....When I tried to
explain apogee and perigee and LOS and TCA and LOS   that pretty much
sealed it.......they got me hat with LIS on it......they said it means
Lost In Space.....
I lost all credibility when I told them I talked to a woman in
space..and she answered me.....
I guess I better not show them my "station"   seeing all these antennas
and radios and computers.......probably would be more than they could
handle......what other hobby could you bounce signals off a tool box and
a tape measure... or use an eggbeater....or an inverted V..and talk in 3
letter words...QSL QRM...???
or a coffee can.......or walk around with radio, gps, tnc, boom
mike....and not work for the secret service.....EH!!!!
/What a wonderful hobby........
To all of you...you know who you are....who make our incredible hobby so
exciting....I thank you......and future generations will
too..........ve7whk

has anyone built the http://www.tapr.org/tapr/html/Ft238.html TAPR weather kit? I was looking at the microweather http://www.qth.com/RXcomm but it does not include all the parts... does anyone know of the advantages and disadvantages?

does the micro weather support the rain bucket?

I am looking to set a station up with one soon...

Anyone use a VHF Mobile Commercial Transceiver for aprs?
Looking at GE Phoenix-SX or an MVS? Any luck with these?
Know of a source or someone who can program them?

73 thanks

What pins on a DB-15 VGA connector are used to sense the presence of an
external monitor on a laptop? I suspect it is one of the 3 RGB grounds,
but figured someone would know for sure...

Bob

         I bought a Phoenix SX from Buck at www.packetradio.com a good
while (a year or two?) ago.  It works absolutely WONDERFULLY and has never
given me any problems.  As I received it, it outputs about 60 watts on
144.39, can easily be turned down if necessary, but I've left it at 60
because of the huge distances between digis here in New Mexico and west Texas.

I use several Phoenix-SX radios for APRS, they work great, are cheap,
are very easy to modify for APRS and you can adjust the power from about
10-60 watts

I've used Motorola mobiles (all types) and GE Phoenix SX radios, but have
had bad luck with MVS radios.  If the Phoenix radios are the type with the
removable 18 pin EEPROMS, I can program them.

Rendered body type: text/plain

It was brought to my attention that my http://www.ae5pl.net/NWSRadar.asp
and http://www.ae5pl.net/NWSRadars.asp did not work with Netscape
Communicator. The work now.

Also, the URL's were all to the southern region (which came up bad for
radar sites in other regions). The URL's are now correct for each
region.

Enjoy.

Check out K4ABT's
www.packetradio.com

He is selling converted GEs for VHF and UHF already preprogrammed for the APRS and packet channels.

Kindly pass along your opinion of this radio...I
am considering one of these radios, and would like to
know how it is.
I don't plan to run it for packet/APRS, being that it
has no separate connector for running a patch cord/cable.
I intend to only use it for a mobile rig.
Also:
Have you done the mod for out of band receive?
I read about it on QRZ.com, and would like to know if it
is necessary to go in and cut the diode mentioned, if I only
am interested in RECEIVE out of band, and not concerned with
transmitting (especially since this would be ILLEGAL).
Tx.

```
The 2100H does not need a mod to receive out of band.
There is no reason you can't make it work on APRS/Packet, you just need to
make up a cable or get one of the MFJ switchboxes.
Now that the BRAND NEW 2100H is about $125 or so, I can't believe that all
the old 2 meter stuff on EBAY is getting bid up higher than that. I think
that if a new 2 meter is $125, a 10 or 20 year old rig is worth about $50 to
$75 max.

Have I missed it or is there a way to display battery status on this radio?

Thanks for any help

The 2100H does not need a mod to receive out of band.
There is no reason you can't make it work on APRS/Packet, you just need to
make up a cable or get one of the MFJ switchboxes.
Now that the BRAND NEW 2100H is about $125 or so, I can't believe that all
the old 2 meter stuff on EBAY is getting bid up higher than that. I think
that if a new 2 meter is $125, a 10 or 20 year old rig is worth about $50 to
$75 max.

791. [aprssig] More DX via PCSat!

From: "Eric Mackie" <9z4cp@rave-tt.net>
Date: Sun, 27 Jan 2002 11:13:57
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-59468-2002.01.27-11.44.19--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I had another great pass from PCSat last night. I am not transmitting to the satellite, as I am in dreamland when it passes, but I am receiving some long distance stations. Last night I copied KB8DID, up near Detroit, and when I hooked the station, APRS told me he was 2547 miles away. That's even further than the VE2 station on the 25th. I noticed a couple things, though. One is that a symbol for PCSat was on the screen. It was just north of the Caribbean, at 1826.38N and 06325.39W. When I hooked KB8DID, the PCSat symbol was repositioned to a location in the Atlantic, almost directly East of KB8DID. Is this position where PCSat heard KB8DID and digipeated him to me? According to my rough calculations, that's a dogleg of approximately 3700 miles!

The other thing I noticed is that in both the contact the day before and
the one today, the stations were using aliases of WIDE(VE2CUZ), and
WIDE,WIDE(KB8DID).
I thought everyone understood that was not to be done.

Great to hear all of you down here.
Eric Mackie 9Z4CP.

Rendered body type: text/plain

I need to access the findu.com database to extract weather data. About 2
years ago, Steve publicly provided the username and password and I wrote a
perl script to access the database, but it no longer works. Has Steve
stopped "direct" access to the findu.com database?

Anyone have perl code that currently works to access the database.

thanks in advance, W9IF
Rich Parry

Rendered body type: text/plain

Hi Andrew,

I have not confirmed this because of where the D700 is at the moment.

I would connect a PC to the D700. Turn the D700 on, and set to TNC Packet. Then with the PC, query the parameters of the tnc with a communications program, (Winaprs, APRSDos, or HyperTerm). I.E. TXD The tnc will respond with the setting like Txdelay 33. Set the TXDELAY with what you need from 1 ~ 120. each unit consists of 10 milliseconds.

To see if it holds when you set the D700 to TNC Aprs, switch the D700 to TNC APRS, wait a few seconds, then switch it back to TNC Packet and read the TXDELAY again to see if something in the firmware of TNC Aprs changes to a default. I don't think so, :-)

I have not found a reason to change it, but then , I only run it in TNC APRS mode with a GPS connected...

Am curious as to what you find..

Robbie

798. [aprssig] RE: Icom IC-2100H Users/Owners

From: "Jason Armentrout \(N4DSL\)" <n4dsl@atrs.com>
Date: Sun, 27 Jan 2002 22:20:52 -0500
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-59546-2002.01.27-21.53.28--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I own 2 Icom 2100H rigs and I think they are the best low cost 2m rig you can buy. It has every feature you would want in a 2m rig and has a very nice receive on it. And you can't beat the price you can get one for, about $145 new.
I use one as a base in the shack and I have one on the mountaintop on my APRS digi and works excellent for my digi. It is easy to hookup to a TNC. I use a Kantronics KPC3+

I would surely go with this radio, if all you need is 2m.
The others are right, the used stuff it going way over what it should. I guess people don't shop around.

Kindly pass along your opinion of this radio...I
am considering one of these radios, and would like to
know how it is.
I don't plan to run it for packet/APRS, being that it
has no separate connector for running a patch cord/cable.
I intend to only use it for a mobile rig.
Also:
Have you done the mod for out of band receive?
I read about it on QRZ.com, and would like to know if it
is necessary to go in and cut the diode mentioned, if I only
am interested in RECEIVE out of band, and not concerned with
transmitting (especially since this would be ILLEGAL).
Tx.

Is there a URL that just returns the information about one radar site as a
text/plain document with a separator such as ',' as in.

KINX,lat,lon,gifleft,giftop,...

That would make it easy for the applet to get the right information and not
have to put it into the HTML tag.

Also, the reference URLs for the composite and non-composite images could be
selectable URLs so that one could put in lat and lon and then just click on
the closest one.

Rendered body type: text/plain

Stan, et al....

Due to the changeover to DSL, my ku0g@kcaprs.org address is temporarily
disabled as it all forwards to ku0g@earthlink.net. Until Earthlink gets
it's act together, I have re-subscribed to the list as
jdbandman@earthlink.net.

Those who have me in their address books should edit their entries to
reflect this change. I anticipate having ku0g@kcaprs.org working
properly sometime Monday....

Stan: If you would make this change to ALL of the TAPR APRS groups I'm
on it would help speed the process up a bit here as we re-group....

Subject: [aprssig] Re: D700 TXDelay

Hi Andrew,

I have not confirmed this because of where the D700 is at the moment.

I would connect a PC to the D700. Turn the D700 on, and set to TNC Packet. Then with the PC, query the parameters of the tnc with a communications program, (Winaprs, APRSDos, or HyperTerm). I.E. TXD The tnc will respond with the setting like Txdelay 33. Set the TXDELAY with what you need from 1 ~ 120. each unit consists of 10 milliseconds.

To see if it holds when you set the D700 to TNC Aprs, switch the D700 to TNC APRS, wait a few seconds, then switch it back to TNC Packet and read the TXDELAY again to see if something in the firmware of TNC Aprs changes to a default. I don't think so, :-)

I have not found a reason to change it, but then , I only run it in TNC APRS mode with a GPS connected...

Am curious as to what you find..

Robbie

Hi there,

The following caught my eye in the description of a newly proposed satellite (not the Eagle project) in the most recent Amsat newsletter:

```
<quote>
* repeat 1200-baud AFSK APRS packet data through the satellite's
  analog repeater
</quote>

How reliable is repeating AFSK with an analog repeater?

73s,
--Alex

Congrats to Bob Bruninga nd his team on the Associated Press story that
ran in the Star newspapers that cover Ventura County California.

The sizable piece (complete with a color photo of Bob and an
illustration of the "bird") appeared on the fron page of the
Business/Technology section of the newspaper. Only a tiny mention of
amateur radio, but the focus of the story was on the economy of the
satellite.

Very, with the same kudos as setting any radio up with AFSK into a FM
rig. Some of our first packet here in Detroit/Ann Arbor (and I
understand Tuscon) was over a repeater... the 220 arrow repeater. Later
a few of us set up a tone regenerating 440 full duplex packet repeater.

Understand that with a repeater, CSMA actually works as the repeater
lets everyone hear everyone else (and in effect defines the LAN size).
The difference in throughput is dramatic.

Now, a even better method is a regenerating repeater, which has a Bell
202 demodulator on the receiever and then remodulates the tones on the
TX (in effect to back-to-back TNC's). This guarentees perfect and
consistent tones on the TX side (although it can't fix bit errors).

using repeaters on the terrestrial packet network is something that should
have been done more often than it was; a repeater is much preferable to a
digipeater for the reasons stated.

For satellites, I think regeneration is essential. We tried that years
ago on AO-27 when we first turned on the bent-pipe repeater. 1200 baurd
AFSK would go through, but was very prone to errors - all the noise
received by the satellite becomes part of the downlink signal.

There's also the question of ease of use of AFSK (modems are plentiful and
inexpensive) versus using a better modulation scheme (more reliable but
where do you get the modem?).

811. [aprssig] Unlicensed CB-type anarchy moving in on GMRS radio service

From: WA8LMF2@aol.com
Date: Mon, 28 Jan 2002 17:37:53 EST
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-59688-2002.01.28-17.08.25--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

This story is reproduced from a local suburban newspaper in the San Francisco area.

Published Sunday, January 27, 2002 ContraCosta (California) Times

Two-way radio business booms

Two-way radios, once known as walkie-talkies, are becoming a hot consumer product, thanks to aggressive marketing and huge price cuts. Family Radio Service, or FRS, radios now sell for $15 to $50, and radios using the longer-range General Mobile Radio Service, or GMRS, start at $50. People are using FRS and GMRS to keep in touch at theme parks, on ski slopes, across school campuses and around construction sites. The radios are even squelching the age-old sound of parents yelling down the street to summon their children for dinner. FRS, in particular, is booming.

The Federal Communications Commission set aside a frequency band for FRS in 1996, with no license required, to support low-cost, low-power two-way talk. Prices were relatively high in the beginning, with FRS radios running $100 to $200, and sales were modest. But, as with all things electronic, prices moved downward -- pushing consumer enthusiasm up. Motorola (www.motorola.com/talkabout <http://www.motorola.com/talkabout>), one of the three biggest makers of FRS radios along with Audiovox (www.audiovox.com <http://www.audiovox.com>) and Cobra Electronics (www.cobra.com <http://www.cobra.com>), says FRS sales zoomed from 500,000 units in 1997 to 1.75 million in 1998, 5 million in 1999, 7.5 million in 2000, and an estimated 9.1 million in 2001.
FRS gained popularity because there is no monthly service fee, as with mobile phones, and because they are inexpensive enough to give to children. The biggest limitation of FRS is range: The radios are limited by the FCC to one-half watt of transmitting power, which manufacturers advertise as enough to cover two miles. But that's under ideal conditions; typically, FRS radios can't reliably communicate much more than the distance of a few city blocks. FRS users must also adapt to the walkie-talkie mode of chatting, where you push a button to talk and can't hear a reply until the button is released.

GMRS predates FRS by many years but was largely restricted to professional users because the radios were expensive. In 2001, however, manufacturers figured out how to apply the high-volume production techniques of FRS to bring down GMRS prices. The industry was also helped by slumping demand for personal computers and wireless phones, which use some of the same components as two-way radios.

The results were dramatic: From a price range of $200 and above, GMRS radios went under $100 for the first time in mid-2001 and kept dropping, to the point where some models now cost as little as $49.

GMRS radios typically offer two watts of transmitting power, enough for an advertised range of five miles. Again, that's more than most users will get, but the range should still be double that of FRS.

Most GMRS radios can also receive and transmit on FRS frequencies, so a family or other group can mix FRS and GMRS units without losing touch.

On paper, there's one downside to GMRS: The radios require an FCC license. Users are supposed to send the federal agency an application form and check for $85 to get rights to operate a GMRS radio for five years.

Most GMRS buyers, however, never bother with registration -- a reality the industry won't discuss on the record, for obvious reasons. At the risk of encouraging civil disobedience, I can say there's not much risk in going without a license; the FCC isn't making a significant effort to enforce registration.

With lower prices, GMRS is starting to take sales away from FRS. Audiovox estimates GMRS accounted for only 7 percent to 8 percent of its two-way radio sales in 2000, with FRS taking almost all the rest. But GMRS jumped to 10 percent to 15 percent in 2001, and the company is forecasting 20 percent to 25 percent in 2002.

Manufacturers are doing more than slashing prices; they are also trying out variations on the familiar hand-held design.

Audiovox introduced FRS and GMRS base stations last year, tabletop units that could sit on a kitchen counter, for example, so Mom and Dad could listen for a call from the kids without having to carry around a radio. Cobra and Garmin International (www.garmin.com <http://www.garmin.com>) have introduced FRS/GMRS radios with built-in Global Positioning System receivers, so you can see where you are as well as talk. And Audiovox will ship a $99 GMRS model this summer that boasts three watts of transmitting power, raising the advertised range to seven miles.

I borrowed the Audiovox FRS1000 base station, which has a list price of $69.95 but sells for about half that amount, along with a pair of Audiovox FR1428 radios and tried the kitchen scenario. Walking my dog Kobuk at a park near my home, I could stay in touch with my wife Debbie in the kitchen as she fed our 18-month-old daughter Sara. Signal strength and audio quality were good over a distance of about a quarter-mile. The only problem was that I occasionally had to wait for Debbie to reply, since she couldn't hit the talk button on the base station while spooning oatmeal into Sara.

I also tried a range test by driving in my car away from the house. I got about a half-mile before the signal faded to the point where Debbie couldn't hear me clearly -- about the same range I experienced when I first tested FRS radios five years ago. Once Sara gets old enough to explore the neighborhood on her own, I'm very likely to invest in an FRS or GMRS base station and radio. The FRS1000, by the way, is already being phased out. Audiovox will ship the smaller FRS1100 with a list price of $49.95 in June, along with a similar model for GMRS, the GMRS2100, at $59.95.

If you're interested in joining the two-way chat-a-thon, here's my advice: The least expensive FRS radios, selling for as little as $30 a pair, will do the job for keeping track of children over short distances in residential areas -- and are inexpensive enough that parents won't cringe if one gets lost or broken.

For communicating in busy public places, such as shopping malls or water parks, spend a little more for FRS radios with "subchannels," also known as "privacy codes," to block the voices of other users.

GMRS is the best choice for applications where maximum range is critical, especially outdoor activities such as hiking, camping, hunting and fishing.

Make your own decision whether to send $85 to Uncle Sam for your FCC license.

Rendered body type: text/plain

On some repeaters, yes. On others, no.

Two, and maybe three, things can byte (sorry, stupid pun) you...
(I know, I know, should I be slapped silly with a wet resistor
code for that one? Hey, I know there are a few people that just
want to slap me silly for ANY reason already!)

Time to TX stable. When a repeater 'keys up', the added time for the
repeater to output a stable carrier with data may not be quick enough
for whatever you're trying to send through.

Just needs to be checked...

Another issue is the passband. Some repeaters don't have a smooth
passband envelope. At either end of their passband, they might have
weird phase anomalies or attenuations that can also be an issue.

Finally, some repeaters aren't. They don't repeat. They 'store forward'
with a slight time delay. What this means is when you send something
through a repeater, it may come out the other end a significant fraction
of a second later. Some repeater controllers do this so they can do
'tone detect' on the front end, and mute the signal on the back end.
That way they have a 'buffer delay' to allow for clean tone detection.
Sorta like the 7-second delay Johnny Carson had on the Tonight Show
to allow the censors time to bleeps anything that needed to be bleeped,
only with the repeaters it's less than a second. Usually.

If you send any data through a repeater where a receiver might look for
end of carrier (a data carrier, not RF) and then times and starts sending
a response, that can cause SERIOUS headaches unless it's accounted
for.

An easy way to check if the repeater in question does a store-forward is
to just wait till there is a conversation where you can hear the input and
flip back and forth from input to output with your reverse button if you
have one. If the repeater delays, then flicking fast enough will sound
like
an echo. Or just listen to yourself on a monitor, or other people with
two
monitors, one on input, one on output, and you can easily hear the delay.

Mike

Steve.

What are you saying? A digipeater contains a TNC and a radio. The TNC
modem demodulates the tones, performs it's checks on the data, determines
if it needs
to be repeated and if it does, then it's modem generates the proper and
balanced tones for retransmission. It's functionally the same as a
regenerating repeater, as
described above. Incidentally the advantage of the TNC is that if it
hears
a mangled packet who's CRC fails, it will not repeat it and thus it does
fix
'bit errors' that the regenerating repeater cannot.

Either I missed something, or your point about a regenerating repeater
being
preferable to a digipeater is wrong.

1) The digipeater is a single-frequency device that at maximum can only transmit half the time. A regular repeater (regenerating or otherwise) is a duplex device that could potentially have a 100% transmit duty cycle, thereby achieving almost twice the throughput.

2) If the TNC on the receive side of a regenerating repeater hears a mangled packet, it also would not appear at the serial port outport to be transmitted by the second TNC; at least if the PASSALL monitor mode isn't enabled.

816. [aprssig] Re: Reliability of repeating AFSK through analog repeater

From: "Robert Donnell" <bobdonnell@arkalmus.com>
Date: Mon, 28 Jan 2002 17:33:14 -0800
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-59730-2002.01.28-20.03.45--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

A regenerating repeater does not necessarily have a TNC involved - only a demodulator and a modulator (of the audio tones) at a minimum. An improvement would be to re-time the data transitions (and hence the tone transitions), to clean up any bias or offset in the receiving demodulator at the repeater.   A small/short FIFO buffer is frequently used to aid in the timing regeneration, to compensate for any errors in the exact baud rate of the sending station.

The result is that the transmitted signal is sent in real time or nearly real time with the received signal. CRC can't be "usefully" checked in this circumstance, since it arrives at the end of the packet, after virtually all of that packet has already been transmitter.

The biggest benefit of the repeater is that all of the user stations are able to "hear" when any of the user stations is transmitting, with the consequent huge reduction in collisions. Here in the Seattle area we've used repeaters for packet operations virtually since the first days of amateur packet operations, i.e. before 1985. The first machine dedicated for this service is still operating on 220 MHz, though its days as a 1200 bps packet machine are numbered. Most any day, it'll be moving to 9600 bps, along with all of the other packet repeaters operating in this area.

73, Bob

True, but keep in mind a duplex repeater uses two channels
instead of the just one of the digipeater.  On the surface,
this is a draw in terms of throughput vs. bandwidth,
but the improved efficiency of the repeater in avoiding
frames lost due to hidden-transmitter can tip balance in the
favor of duplex repeating.

 >packet, it also would not appear at the serial port outport to be transmitted
 >by the second TNC; at least if the PASSALL monitor mode isn't enabled.
 >
I'm not sure what this means.  A true regenerating duplex
repeater does not assemble the entire frame before repeating
it.  As mentioned by another reader, delay in repeating the
input to output is problematic, since it re-introduces
the hidden-transmitter problem.

A downside of duplex repeater operation is that distant weak
nodes not participating in the 'local' network could stave
off stronger local nodes, but, in practice, this doesn't seem
to be an issue at all.

One thing to consider is that not all competing signals will
be packet; a strong non-packet signal that is not repeated will
allow packet stations to transmit anyway - with the result of
corrupted frames.  This can be addressed in a few ways, but also
doesn't seem to happen frequently.  Of course, operating packet
on a repeater pair is likely to discourage any non-packet users
from listening ;-)

818. [aprssig] Guidelines for Msgs to the Sig...

From: Carl Taylor <carltt@bellsouth.net>
Date: Mon, 28 Jan 2002 20:49:04 -0500
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-59733-2002.01.28-20.19.21--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

SHORT--AND SWEET

When I was young and unbridled, I worked for a public relations firm as a technical writer. My job: prepare articles for business publications on a wide variety of industrial topics.

.

One day, my boss sent back a manuscript to me, to which he had appended these three "rules for good writing," with the suggestion that I study them:

.

1> Can I say it with FEWER words.
2> Can I say it with SHORTER words.
3> Do I have to say it AT ALL?

.

Stung by his audacity in questioning my Shakespearean prose, I fired back, "No, I don't have to say it at all. But will you continue to pay me?"

Lucky for me, the man was not only wise - in retrospect - but he also had a sense of humor. We ended up good friends.

.

Why this long litany about something that is of no interest to anyone? Well, because it occurs to me that my boss' guiding philosophy could - and should - apply to all of us who use the network. Needless to say, I am firmly convinced that we must do all we can to minimize the aggravation we cause.
Toward this end, I have composed a set of rules - for ME(!) - that I will make every effort to live by.

.

1> I will compose the shortest message I can in response to another.
2> I will reread it, to make it even shorter.
3> I will make SURE the message contributes something; if not, I'll kill it.
4> I will check it for spelling and grammatical usage. And make it shorter.
5> I will try to hold messages to 10 lines, MAXIMUM.
6> I will route message as correctly as possible.
7> I will not GUESS; I will provide only correct technical information.
8> I will be only positive in my thinking, not hurtful or snide.
9> I will try to help the other person, not cut him down or show off.
10>I will not argue pointlessly to prove that I'm right; it does not matter.
11>I will not assume the other person is a dunce; I have not lived his life.
12>I will not use profanity and will write only when my anger has subsided.
13>I will at all times speak quietly, graciously, never in a mean spirit.

Carl Taylor   W9ZGU   Hollywood, FL.

Yes, but only one repeater per coverage area. How do you connect such a system to expand the range of your data past one 'regular repeater'? i.e., a second repeater must be tuned to the output of the first and thus the source would have to continually change frequencies as you move around the area, much as you have to do with conventional voice repeaters.

My take on this is the regerating repeater is technically possible but impractical as a replacement for a digipeater in a network. It's an esoteric discussion at best.

Rendered body type: text/plain

I'm browsing radioshack.com and I noticed the HTX-252 is no longer available unless you happen to find one in a store. I was kinda interested in one for the APRS setup here at home -- the old FT-727R is LONG past retirement age!

Anyway, does anybody know --

1. How the HTX-252 works on APRS?
2. Is something newer in the works?

Thanks,
Earl

Arrrrrrgggghhhh!!!

You people are over-complicating the question at hand. The original question is re-quoted below...

```
At 07:35 AM 1/28/02, Alex wrote:

><quote>
>* repeat 1200-baud AFSK APRS packet data through the satellite's
>   analog repeater
></quote>
>
>How reliable is repeating AFSK with an analog repeater?

Note the question was about a specific satellite and AFSK repeating through
an analog repeater (that's part of that satellite).   The answer is yes it
works and yes it's reliable.   Especially if the satellite's repeater is
designed to deal with the parameters required by AFSK packet.

Simple question.  Simple answer.

With the demise of the Visor pretty much a certainty, I started looking for something similar as a replacement. Of course you'll lose the springboard slot...

Just recently I saw a news story on a "local" company (Des Moines, IA) making a unique Palm-OS PDA.

http://www.handera.com/

The HandEra 330 has both a CF and SD/MMC slots.   It is unique in that the display is rotatable.

It's worth a look.

Rendered body type: text/plain

The 252 has an 8-pin round mic plug. Not RJ-45..

Great rig for APRS in my opinion.   Very low power consumption. Mine ran for weeks with the TNC on a 12V battery.

The PTT interface is a little tricky....sort of like an HT with the resistor off the TX audio. No big deal.

That's one of the problems when technology becomes cheap, available and marketed at the "consumer". I just recently got my GMRS license (because the radios are now cheap and available). So far I haven't noticed much of a problem with traffic here in the KC area.

Most of the "GMRS" radios out there are just a tiny bit above FRS radios. They are hand-held, SIMPLEX ONLY, units putting out 1-2 watts. The problems will come as some of these yocals discover that they can use commercial grade radios, running up to 50 watts, on the service. Or when they figure out that the antenna on there little unit comes off and you can add some gain.

Since this isn't on topic I'll leave it at that.

Here's a related subject that is on topic. Has anyone seen any APRS traffic on the MURS frequencies?

Great words!
My pet pieve is run on paragraphs. Entire pages of Email with no paragraph breaks. If you stop for air, end the paragraph!

Paragraphs separate what you have to say into bite sized chunks. And make it easy to scan the entire email for content beforre having to read every word. Emails without paragraph breaks just get deleted, because I dont have time to read the whole thing to see what the point is...

> Here's a related subject that is on topic. Has anyone seen any APRS
> traffic on the MURS frequencies?

FWIW - Some portions of this response are off-topic; my apologies to the SIG

That topic has been discussed on the MURS mail lists, and has received a lot of flack from the GMRS and PRSG folks who claim that MURS should be a mobile and portable medium only; not for fixed station use. However there are no limitations in the FCC charter to suggest this was their original thought.

The MURS freqs are 151.820, 151.880, 151.940, 154.970 and 154.600

BTW, these frequencies were removed from the commercial list when MURS was created, so the topic of this thread is somewhat amusing. It is unfortunate when the knee jerks so violently that it bloodies the face of the reactor. I don't think that removing all traces of the Citizens Band Radio Service from past and future history would solve the problems that the Amateur Radio service/hobby has facing them currently, and until that is realized there will be little corrective action or forward motion.

It is rumored that the MURS was created by the FCC in retaliation to the number of GMRS users who were ignoring the license requirement and using the radios out of the box. These folks were predominately business/contractor based and far removed from the CB Community. The discussions so far in the MURS mail lists don't suggest a tremendous following evolving from CB circles.

Also worth mention here:The FCC is entertaining requests for reconsideration of the MURS charter from Motorola and others.....

It's future is still undetermined, but yet to be undermined; and is a distinctly separate service from GMRS.

****

Below is a portion of the MURS FAQ that addresses the topic. The link for the MURS FAQ is included after the quote below

"Yes, so long as the emissions are authorized in 90.207 of the FCC Rules. In addition, the authorized bandwidth is 11.25 KHz on frequencies 151.820 MHz, 151.800 MHz and 151.940 MHz. The authorized bandwidth is 12.5 KHz on frequencies 154.570 MHz and 154.600 MHz. [95.631(i)(b)] "

"Hooking up a packet radio controller (TNC) to a MURS radio appears to be permitted so long as the emissions meet the requirements of 90.207 of the FCC Rules, and the emission bandwidth complies with the limits of 90.209 and 95.631(i)(b) of the FCC Rules"

Well, good weather and so I hung my 10.151 HF APRS antenna back up and for the first time in years, listened.... People are there. ANd, conincidentally out of the Blue, I got this from Jeff this morning:

> Good morning Bob. I'm involved in a discussion on the Ui-View group about HF
> packet. It is about the HF frequency used for APRS. We are moving towards
> 14.103. I'm sure you've been there done that etc, with the people on 14.105
> etc. I'm sitting on a fence here, I like to work both frequencies. 10.151
> and 14.105. [should we move from 30m to 20m in the US?]

No, maybe, Yes, whatever.......

1) 30m is absolutely 100% APRS and no QRM and an ideal band. The ONLY problem is that there is some "rule" in europe that it cannot be used for packet. THat rule is obsolete, and its intent to protect the band from packet saturation DOES NOT apply to APRS operations which is a ONE-FREQUENCY mode of operation. Its time to CHANGE the rule!

2) We need a frequency on 20m also. For DX and live operations... Go for

it!

de WB4APR@amsat.org, Bob

http://www.synergenics.com/sc/default.htm

Intresting, it is a software repeater for voice... is there something out
there like this for aprs?
Would be a neat hack to have something like this for a jump an run digi.

835. [aprssig] Programmable sub $100 tracker radio

From: John Kraus <jfkraus2@home.com>
Date: Tue, 29 Jan 2002 10:31:45 -0500
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-59846-2002.01.29-10.01.22--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Just a brief note to let those interested know that the Icom IC T2H sport
HT is on sale at AES for $89.99 with an instant coupon. However, you might
want to call soon as I do not know how long the sale will last. I bought 2
to use for basic voice and ARES use. However I got to thinking this might
also be a good radio for a APRS tracker.

It comes with an empty battery pack that can hold AA Nicads alkalines or
Nimhs. The radio uses a BNC connector. It offers 1 or 6 watts on 9.6 volts
and has 43 memory channels. At the top of the back where the battery pack
attaches are two screws with spring contacts to make the connection. It
should be simple to use a diode chain or make an LM317 regulator to drop
the voltage to the 9.6 that the radio requires and cover it all with the
battery shell.   It is very easy to program and also has all 10 Weather
Frequencies available with one button push if you reprogram a multi
function key. Yes I know 13~ volts would be easier; but ya can'a have
everthin mon. For all I know it may work fine but I won't risk it when the
fix is simple.

All in all I am very impressed with the radio so far.

P.S.
I am looking for the cable construction details for the radio to radio
cloning cable for the Icom IC-T2H. The list is $20 with shipping and I
feel sure that unless it contains some funky electronic gismo that I should

be able to duplicate it for substantially less. The manual describes it as connecting the speaker jacks together. These jacks are stereo so I wonder if there is some form of crossover or is it straight through? Is there any resistance pad inline or diode OR-ing? I hope to use these for emergency comms and the ability to program one and clone the other would be very helpful. If there is any aftermarket computer program that can store and upload frequencies I would also be interested.

836. [aprssig] WinAPRS 2.5.1 - anyone else ever seen this ???

From: Maiko Langelaar <maiko@slmsoft.com>
Date: Tue, 29 Jan 2002 09:35:22 -0600
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-59847-2002.01.29-10.12.20--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Hi,

Just noticed some traffic from a WinAPRS 2.5.1 station that seems to have the source path header corrupted on every packet that I receive from the station. Examples below :

```
   VE5RHF>APZ186,RELAY,WIDE,WIDE [01/29/02  09:30:47]:!5207.63N/10638.35W#PHG44 [snip]

   VE5SO>APW251,VE5RHF*,WIDE [01/29/02  09:29:21]:=5208.76N/10641.33WcPHG5391/WinAPRS 2.5.1 [snip]
```

Is this a bug that has been fixed in a later version ?

or is it a TNC setting gone astray ?

73 Maiko / VE4KLM

> 'bit errors' that the regenerating repeater cannot.

Yes.  Maybe I'm using the wrong terminology.  I wanted to distinguish
between a "bent-pipe" repeater, such as a typical terrestrial voice
repeater, AO-27, or UO-14, and a system that "regenerated" the signal
before transmitting it.

> Either I missed something, or your point about a regenerating repeater
> being preferable to a digipeater is wrong.

I was trying to point out that running 1200 baud AFSK through a voice
satellite repeater, e.g. AO-27 or UO-14, could and does work, a system
that decodes the packets and retransmits them on the downlink/ouput will
be far better for the reasons you and I stated.

The other point about packet repeaters eliminating the "hidden
transmitter effect" is very important for systems requiring connected
traffic (terrestrial packet) or high throughput (satellite).  APRS gets
around this by trying to keep packets short, minimize the channel
required for individual stations, and not requiring connections to pass
useful data.

I hope this clarifies what I posted, I think we're in at least general
agreement.

Mark - I agree that it works. I disagree that it is reliable on either
UO-14 or especially AO-27 because there is no clean up of the signal
received by the satellite. At least this is what I think based on limited
testing we (AO27 command stations) did on AO-27 in 1993-94. Since I have
not tried sending 1200 baud AFSK through either UO14 or AO27 since then,
I'll defer my opinion to those with more recent experience.

I note in contrast, however, that digipeating UI frames through ISS or
PCSAT appears to be far easier with simpler equipment. That's two data
points for doing something with the bits before relaying them.

I also agree that sending anything other than UI frames through a
satellite link (bent pipe or regenerating) is unworkable, unless there is
a robust channel control protocol implemented on the satellite and ALL
uplink stations comply.

Maiko,
  This is a timestamp (TNC2 command MStamp ON/OFF) provided by the TNC.
Whoever gateed this packet must have MStamp on.

Some APRS client applications remove this and similar unneeded information
(<UI> etc) before passing the packet on to the IS. AHub and possibly other
Servers and hubs remove this from the header before relay.

> useful data.

I could argue this, however this is simply incorrect, APRS does not get a pass on the laws of packet physics. If anything, APRS makes a bad sitution worse. The only way APRS "gets around" basic packet radio theory is by brute force.... i.e. duplicating packets ad infinutum in the hopes a few will get through.

Connected, unconnected, or otherwise, a CSMA system (which APRS makes a attempt at being) needs to have working CSMA. With extremely extended simplex LAN's beyond line of site, it is impossible to get a CSMA response hence channel throughput suffers. This applies to short, long, connected or unconnected packets.

As a SYSTEM, APRS is very inefficent in its use of channel bandwidth. No insult to anyone or naysaying, this is just a fact and we shouldn't try to convince ourselves otherwise.

-Jeff

843. [aprssig] Kenwood D700 beeps in .WAV audio format for use with APRS programs.

From: WA8LMF2@aol.com
Date: Tue, 29 Jan 2002 20:58:33 EST
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-59917-2002.01.29-20.29.17--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I have been using .WAV audio sound effects in various APRS programs including UI-View and APRSplus. I have found that the Windows multi-media drivers sometimes lock up and hang the PC, if many sound-producing events happen in rapid succession; i.e. one sound isn't finished before the next one is started. The problem becomes especially severe when the system is trying to redraw maps at the same time on slower PCs.

To reduce this problem, I have carefully selected a set of varied and distinctive sound effects that are less than a half-second each and have downsampled them to the lowest resolution and bit rate that will still provide decent quality. The hanging problem on my Dell Inspiron 3000 laptop (233MHz MMX) was completely eliminated by using these smaller, shorter files. I have placed two ZIP files on my web site.

One, KenBeeps.zip, contains 5 versions of the two-tone "beep-boop" sound that the Kenwood D700 makes when it hears your own call being digipeated. You can use these to make UI-View or APRSplus sound like a Kenwood 700 in it's internal APRS mode.
I "tape-recorded" this sound by connecting the speaker jack of my D700 to the line-input of a PC (i.e. normal soundcard interface hookup). I then captured the signal into a .WAV file with the CoolEdit Pro audio editor. Since the beep-boop can be annoying at full volume, I created 3 different versions of the sound at low, medium and high volume levels.

The other contains an assortment of 20 other short sound effects in the file MiscWAVs.zip. Experiment with these. Depending on the audio response of your speakers (especially the tiny built-in ones on laptops), the impact and audibility of these various pops, clicks, beeps, and bongs will vary widely.

The page within my website with the audio downloads is:
   http://members.aol.com/wa8lmf/aprs/wavaudio.htm

844. [aprssig] Re: Unlicensed CB-type anarchy moving in on GMRS radio service

From: "Robert M. Butts" <kb5yqh@arrl.net>
Date: Tue, 29 Jan 2002 20:15:17
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-59918-2002.01.29-20.45.45--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

That is humorous that they took bandwidth from the COMMERCIAL users (for a change) for MURS. Clearly, the "commercial-type" users are the biggest violators (like TV production companies who think nothing of using the 2M ham band for their internal coms). I've seen this often with security companies and (unfortunately though rarely) the military.

The fact is that amateurs usually follow the rules. That's why we submit ourselves to (fairly challenging) tests and ID every 10 minutes like clockwork.

As I see it the biggest limitation to MURS as a digital mode is the 2 Watt power limitation. But... for running a group of unlicenced trackers at some event...I can see possibilities.

Anyway, it's out there. An unlicensed digital band. Wonder if it will last?

Bob, kb5yqh@arrl.net

845. [aprssig] Arkansas Airport Weather - Bad Icons

From: "AE5PL Lists" <HamLists@ametx.com>
Date: Tue, 29 Jan 2002 21:07:03 -0600
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-59948-2002.01.29-21.37.37--lyris.aprssig#tapr.org@lists.tapr.org>

Rendered body type: text/plain

The following is a position report put out by someone translating
airport weather reports:

```
KTXK>APRS,TCPIP,KK5WM,KK5WM-6,I:@291753z3327.37N/09359.25W200/011g000t07
2r000p000h78b10165wMETR
```

This means the icon is /2 (a 2 in a box). I would guess the intent was
to show wind out of 200 degrees, but the icon identifier is missing.
Whoever is doing these translations might want to relook at the position
packet. This mistake is on all translated position reports.

846. [aprssig] Re: Arkansas Airport Weather - Bad Icons

From: "James Wiles" <kk5wm@ncaars.org>
Date: Tue, 29 Jan 2002 21:36:14
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-59955-2002.01.29-22.06.45--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I took care of this after the first batch went out (I saw the incorrect
icons also). I just inadvertently left out that one identifier when
modifying my original code. Everything should be clean now. Thanks for
the report, tho...I know someone was watching!

Thanks and 73...

James Wiles KK5WM

can anyone tell me how to erase memories in the 733 or just block them from
scanning? I use one half of this rig for aprs, the other half as a scanner.

Wes

Good day -

I just went to my local Radio Shack store and bought one of their cigarette lighter plug with appropriate power plug adapter and it works fine. So, you should be able to build your own, and I don't think it needs any special filtering, but you can add filtering if necessary in your vehicle.

Arnie, N1BAC

?APRSP - sends a location beacon.
?APRSS - sends the status text.
?APRSO - sends your active objects.
?APRSD - sends a list of stations that have been heard direct.
?APRST (or ?PING?) - sends the route by which the query was received.
?APRSH <callsign> - sends information on when <callsign> was last heard.
?VER? (not an APRS query, but some APRS software supports it) - sends information on the software version in use.
QAS - causes your system to Query All Stations.
QWS - causes your system to Query WX Stations.
BCN - causes your system to send a beacon.
LGS (or LG1) - enables logging, using a log file named according to the date. (This command must come from the station callsign.)
LGX (or LG0) - disables logging. (This command must come from the station callsign.)
DX - causes your system to send an abbreviated best DX report.
!program - runs a program in the RCOMMAND directory

850. [aprssig] PSK-31 Email

From: Bob Bruninga <bruninga@usna.edu>
Date: Wed, 30 Jan 2002 08:38:21 -0500 (EST)
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Cc: TAPR APRS Special Interest Group <aprssig@tapr.org>
Message-ID: <LYR842-60016-2002.01.30-08.09.01--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Has anyone written an Email Engine to work with PSK-31?
I assume one can use UI-view to send APRS packets over PSK-31 and then those could be IGated to APRServe, adn then the WU2Z Email engine would pick it up, but I need a PSK-31-to-EMail engine standalone...?

Bob

The greatest thing for mobile Operations I have found is a small square
piece of no-skid carpet underlayment stuff.  Just lay it on the dash, and
lay anything on it and it stays put.  Even a full sized mobile rig.

Yes, this is dangerous, stupid and should not be done... but it works.
Bob

You can go to Wal-Mart and in the kitchen stuff for plates and pots and
such find a ROLL of material that is designed for shelf lining where
plates
stand on edge for display. It's like a piece of really thin rubbery foam.

For about $4 or so, you can have enough to make 20 or more of the same
things you find at the electronics stores. And I think it works a little
better.

I've been using it with my GPS units for a couple of years now.

Mike

Goes without saying that the dash airbag could launch anything relatively loose so I would put it as far
 toward the windshield as possible. I like the non-marring approaches best. In my case, even my
non-marring bracket left a discolored dash apparently because of sun fading in contrast to the shaded
bracket area.

```
I managed to download the 51MB zip file of the FCC Database.
I put it into the DATA file, but I can't make any information come
up if I click on the BOOK button, on a stations' window.

What am I doing wrong?

There are several files in the database folder.
Do they need to be in the Database folder individually ?

858. [aprssig] Some handy UI-VIEW Commands (revised)

From: "Andrew Rich" <andrew.rich@bigpond.com>
Date: Thu, 31 Jan 2002 06:25:54 +1000
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-60070-2002.01.30-14.56.15--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Send these commands to UI-VIEW as a message

?APRSP - sends back a location beacon.
?APRSS - sends back the status text.
?APRSO - sends back your active objects.
?APRSD - sends back a list of stations that have been heard direct.
?APRST (or ?PING?) - sends back the route by which the query was received.
?APRSH <callsign> - sends back information on when <callsign> was last heard.
?VER? (not an APRS query, but some APRS software supports it) - sends back information on the software version in use.

With "Remote commands" enabled in UI-VIEW, you can send the follwoing commands that are specific to UI-VIEW

QAS - causes your system (the Ui-VIEW station) to Query All Stations.
QWS - causes your system (the Ui-VIEW station)to Query WX Stations.
BCN - causes your system (the Ui-VIEW station)to send a beacon.
LGS (or LG1) - enables logging at (the Ui-VIEW station), using a log file named according to the date. (This command must come from the station callsign.)
LGX (or LG0) - disables logging at (the Ui-VIEW station). (This command must come from the station callsign.)
DX - causes your system (the Ui-VIEW station) to send an abbreviated best DX report.
!program - when sent to (the Ui-VIEW station) runs a program in the RCOMMAND directory

```
My airbags come out from the 'far right' of my dash for the passenger, and
from the wheel for the driver.  In addition, my passenger airbag is a unit
that deploys from the 'edge'.

Of course, anything on the dash 'could'
slide around and be over the air bag area in an accident, but since my
bags
deploy 'back' and anything on the dash will go forward, I think there'd be
more danger from anything in the vehicle going up at the dash than from
something on the dash 'away' from the bags sliding into the way.

Mike

         My opinion is that I NEVER post to APRSSIG about putting things on
```

```
the dash of my car, because someone will invariably tell me not to do so,
quoting the danger of the air bags launching said items, even though they
have no earthly idea:

         1.  What kind of car I have
         2.  Whether it has air bags or not, and
         3.  Whether the items I put on the dash are even near the bags.

         7 3
         Earl

My buddy Earl once told me he wanted to always keep his HT on the dash so
in the event of a crash, the air bag would get it to him quicker.  He
knows no one listens to the mic-e emergency messages so he wants that HT
right up by his face in a hurry!!!

His Buddy Jim

(Sorry Earl, slow night on the sig...)

Someone may have retrofitted your 1967 Chrysler Newport with airbags, without your knowledge. Better safe than sorry.

Remember, never put anything in your mouth while driving either, lest the airbag spontaneously deploy and drive the lollipop, pipe, cigar, toothpick, etc. through the back of your throat, causing instant death. And remember no one died of blunt force trauma in a car accident prior to the invention or use of airbags. Never mind that women and small children are 30 to 40 percent more likely to suffer brain stem or cardiac arterial tearing than a 35 year-old 180 pound male, in any given serious trauma, and that this trauma can happen at 8 MPH or less...

The mere deployment of an airbag can kill small children, women, and rodents within a 60 foot radius of the car. My brother's wife's co-worker's cousin's neice's neighbor's babysitter was killed by an airbag, so it's no laughing matter.

Also, never drive your vehicle, lest the airbag spontaneously deploy,
causing you to loose control of your vehicle and drive into oncoming
traffic, or a roadside hazard!

Gotta tell the boss I'm not going to make it to work in the morning...

866. [aprssig] Dash mounting

From: Alan Heaberlin <amh@as.net>
Date: Wed, 30 Jan 2002 22:40:38 -0800
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-60157-2002.01.31-01.10.11--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Things that look dangerous always spook me even if after I have already
made the installation. I took the dash apart on my Ranger 4WD and
permanently added a bunch of brackets and a piece of unistrut that I can
always figure out how to make a mount out of. Anything that sits loose on
the dash though (airbags and windbags notwithstanding)generally presents a
hazard only if you are soundly rear-ended, in which case the injuries will
only add to the value of your lawsuit against the senior citizen or
oriental who clocked you (Ok Ok flame suit on).
If you want a real chill, my neighbor mounted an entire FT570 HF rig on the
ceiling of his pick-up right behind his head. He still can't understand why
I won't ride with him.
Now I better run before Mad Stan figures out that this ain't exactly
on-topic. Sorry Stan I couldn't help myself.

The problem is that as Earl has so humorously pointed out, is that there is

a contingent of people on this SIG who seem fixated on the dangers of
airbags, and will email you privately (or not) about how they heard a third
hand story of someone being killed by a mug propelled out a car window by
an airbag or some other such nonsense.   We've also seen claims that the
airbags in US cars are somehow inferior to airbags installed in cars in
other countries.   I will note that most of these emails I have gotten
orginated from VE land... ;)

Recently, I made a remark in jest about someone on this SIG being
cheap.   He took umbrage at my comment and was very upset.

I, on the other hand, am not so thin skinned, and accept the title of
windbag in the spirit it was given.   I have been called far worse... ;)

Many users of my server may have noticed some interuptions in the feed.
This is due to my ISP's (Cox@home) transistion process to their own
server network.   As of right now, all traffic is being routed through
Atlanta (Corp. HQ for Cox) to monitor and test the new network.   I've
been told this process will be completed by the end of the week and
hopefully, everything will go back to normal.

Rendered body type: text/plain

```
I have released javAPRS 2.2 build 06.  It is available from
http://groups.yahoo.com/group/javaprs/files for members of the javAPRS
mail list or from the sites listed at http://javaprs.ae5pl.net  For
those of you using javAPRS in your web pages, come join the mail list.
The member list is hidden to prevent spammers from using it.  It is a
great way to provide feedback and see what other people are doing with
javAPRS.

Build 06 has some bug fixes, has added the ability to scale the icons,
and supports most browser Java VM's.  As always, I am very interested in
any feedback, suggestions, or bug reports.  This build appears to be
very stable.

Oh oh, and "I" may fall into this category.  But not for airbags.

I suppose most people have 'trigger' issues.  With me, it's slingshots
and the way some people use them to launch antennas.   Being someone
who HAS been 'bopped' on the forehead when a line feed snagged
while doing this before they learned the tricks, and also someone
who has had personal experience with blind individuals (both from
birth and those that have gone blind for various reasons) and even
personally knowing people (one of the kids in scouts) who lost an
eye due to a careless accident, I can be obnoxious at times.  Especially
when all it takes is just a bit of caution to raise the safety bar
immensely.

But, I do NOT like fluoride being mandated, I'm against helmet laws,
and I've even been known to have a Tootsie Pop in my mouth when
I drive!

Mike

I use a clamp on roof rack on my mini.  Have both my vhf and gps antennas
attached by wraping bungie cords around the base.

But my van is an 86, maybe the new ones don't have the "rain gutter" over
the doors
that the clamp on attaches to.

Look for a "trunk lip mount" antenna, that may work.
It looks kind of like a mag mount, but has a little U bracket that wraps around
  the edge of the trunk, and then is held in place with hidden set screws.
Antenna Specialists used to make it, I don't know if they still do,
cars have changed a lot since I left the two way business!

Hear, hear!  CW is really fun and all but come on.  It's the 21st century.
The Coast Guard figured this out a decade ago.

30 Meter APRS is VERY useful right here in CONUS.  When you look at the
JavAPRS maps you can see the clusters of stations on the coasts (especially
East).

But out here in the "wide open spaces" HF gates are wonderful.  When I was
in SD I had reliable communications with several stations in Wyoming and
Montana as well as LOTS of Canadian stations.  We're talking about some
places where it could be 100 miles to the next house.  I don't think
high-speed Internet (other than satellite) is there yet.

30 meters provides (more or less) 24/7 communications with a reasonable
antenna.  It is (in my opinion) the best option.

73!!

Bob Butts, KB5YQH@arrl.net   ......  Now in Kansas :)

ps.  Wow!  VHF, HF, satellites, the Internet....all integrated into a
GLOBAL system.   Who would have thought APRS would turn out like this.
Awesome!

Funny you should ask, I measured it just last night.

The PCB measured 1.6 by 2.1 inches. There's a DB-9 header on it that extended 0.6 inches as I recall (I'm hazy on the header dimensions).

Paul

Yeah, Tim... Byon tells me they're about yay long, by about so wide... sorry, I couldn't resist after reading the windbags talking about airbags. When I built one last year it was about the size of my T-81... roughly 4 by 3 inches. Go to www.byonics.com and take a look at the source.

When Chrysler went to the 'new' design about 1996 or so, they got rid
of the rain gutters. It's now a smooth edge. The racks are now different
too, but the racks are now easily installable.

What Robert was talking about, I think, was a few years ago there was
an antenna mount system that was a 'plate' that attached where the
license plate attached, then the license plate attached to this antenna
plate.
There was a kind of arm on it to mount an antenna.

Don't know if it's even being made or sold anymore. And I have no
idea how it would work against the 'flat back' of a mini-van as opposed
to the back of a car where you are fairly open once you're a few inches
above the plate area.

As to trunk lip mounts, be careful. They will not work on all vehicles.
Some vehicles have too close a tolerance at the hinge gap, or even
'close up' the gap as the back swings up. On some vehicles the hatch
even DROPS as it swings open. (My 88 Daytona was that way!)
And then there are vehicles that it would work, once you get it in there,
but you can't get it in there without disassembly of the hatch hinge
assembly. And with weather sealing so critical, I wouldn't want to
do that. If you want to mount at the top of a hatch, investigate the
mechanical aspects of it CAREFULLY before you do anything you
may regret.

Finally, if you mount on a hatch, consider if it would be an issue if you
wanted to transport something like sheetrock on the roof? That's
probably not an issue with a mini-van, but if you have a small wagon
or hatchback sedan it could be.

Me personally? I'd just use a short mag mount in the center of the
roof. A mini-van is a great ground plane, and a mag mount in the
center performs pretty well. If I had the roof rack, I'd use that for
the 'other stuff' like the GPS.

By the way, I've been told that with the 'newer' Chrysler vans, the roof
racks can be easily removed and reattached. I have a friend with one,
and we're going to hit a junkyard to take one off to see... It might be
an
easy way to get him a roof rack at a decent price.

Mike

Oops, a little big on the measurements... no bigger than 3 by 2, maybe a
little smaller.

Yeah, Tim... Byon tells me they're about yay long, by about so wide...
sorry, I couldn't resist after reading the windbags talking about
airbags. When I built one last year it was about the size of my T-81...
roughly 4 by 3 inches. Go to www.byonics.com and take a look at the
source.

It is not my intent to start another "war" here and argure the arcane and
minutia to death :)

BUT, I am wanting to layout some PC Boards for some APRS gear...

Some of my wish list....

I want the flexibility of sending the results to any board house - so I'm
looking for advice from SIG members WHO ACTUALLY USE said software... and
have personal experience with more than one package... as to what I should
consider buying...

I willl want to do 4 layer boards (max)

I will want to do boards up to about 40 sq inches (4" x 10" - 5" x 8" -
about the size of the existing TNC-2 case....

Bonus points for software that allow some basic analog circuit modeling...

BIG BONUS if it's on LINUX... but I'll settle for Windows based software...

Being a HAM... I'd like to keep it low cost...

TNX in advance...

ALOHA
AH6LS

I have one of these and they are very nice. I use it on my Miata so I
don't have to alter the vehicle to install a radio or antenna. Not cheap
though... about $45. They are still available from:

http://www.hamstick.com/mounts.htm

Thanks for the input... mine does not have the rain gutters.... there is a company which makes a license tag mount http://www.hamstick.com/Tm-1.html . I have searched and searched for the antenna mount that slips in the vertical gap in the rear door and bolts to the inside of the door frame and can't find it anywhere.... guess i'm off to make my own with a cardboard template.

Wes.

Subject: [aprssig] Re: dodge mini van antenna mount

I remember seeing a few years ago an antenna mount for the hatch back of the
chrylser / dodge minivans. I think it was on a website with a license tag
frame antenna mount, but can't locate either one now. Just getting a "new

```
  to me" minivan and need an antenna mount for it.  Anyone got a web site?

  Wes

I use a clamp on roof rack on my mini.  Have both my vhf and gps antennas
attached by wraping bungie cords around the base.

But my van is an 86, maybe the new ones don't have the "rain gutter" over the doors
that the clamp on attaches to.

Look for a "trunk lip mount" antenna, that may work.
It looks kind of like a mag mount, but has a little U bracket that wraps around
 the edge of the trunk, and then is held in place with hidden set screws.
Antenna Specialists used to make it, I don't know if they still do,
cars have changed a lot since I left the two way business!

My wife (KB4FFO) and I are fulltime RVers.  We live in a 37 foot diesel
pusher motorhome.  We use the non skid stuff you can buy at Walmart or any
Dollar store to keep things from sliding around. I even have my MFJ
switching power supply sitting on this stuff.  It never moves.  You can buy
this stuff for about a buck a roll at the discount stores.  >  I have two
GPS receivers, one for our mapping program and one for APRS.  Both sit on
top of the TV set in the front of our RV and both sit on this non skid
stuff. They have been up there for over two years and never move.  Just a
thought.  Its cheap and it works.

```
This is a good topic!  I need some ideas on this.

My D700 and 706IIG are in the trunk, running off a 30AH gel cell that is recharged when the engine is
running.  Faceplates are mounted to their brackets which are tie-wrapped over my dash air vents (it
doesn't look too bad, actually.) AC inverter is under the passenger seat.

I have a standard size 12" screen color laptop permanently dedicated to the vehicle now, running
StreetAtlas 4 off the hard drive and APRS+.  Right now, it sits on the passenger seat, since the Honda
Accord's windshield slopes too steep to have the LCD lid up if it's on the dash.  I need some ideas on
how/where to mount the laptop (some impeding the passenger seat is acceptable.)  Or, disconnecting the
screen from the keyboard base unit...

73,
Skip/K3FOR

```
Skip,

I have a Dodge van and use a 1 1/2" RAM ball mount with a computer tray
mounted on the dash console to hold either my CF25 laptop or just a mini
keyboard hooked up to the D700. These Ram mounts are available in marine
supply stores and have a fully articulating arm to position the computer
any way you like. (not in front of the air bag though)

All kinds of Ram computer mounts are
here:  http://www.ram-mount.com/laptopcomp.htm

Anything not securely mounted in a moving vehicle (boat, RV, car, et al) is extremely dangerous. At the risk of this thread turning into another powerpole rambling, let's just all realize that what's cheap and easy isn't necessarily proper or safe. I've never been struck by lightning, but that doesn't mean it's prudent to go golfing in a thunderstorm. ALL LOOSE OBJECTS will become projectiles in a collision, which will travel at the speed of the vehicle when it contacts a stationary object. You don't want anything flying around the interior at say 50-60 mph. I laugh when I see people lay speakers on their rear shelf, right at head level. Even stuff under a seat can cause injury to legs and feet. Rollovers are just as bad but not quite the same as a sudden deceleration. I think it's silly to have to discuss this, and the air bag issue, and other safety issues, but to promote dangerous practices to others on a public forum, where many may be (and are) impressionable and then they actually DO it, is irresponsible.

This is not a personal attack. Just common sense.

889. [aprssig] NOSaprs 1.11.1 available - Stability Patch, Better down-time handling ...

From: Maiko Langelaar <maiko@slmsoft.com>
Date: Thu, 31 Jan 2002 13:59:12 -0600
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-60282-2002.01.31-14.36.14--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Greetings,

I have released linux update kits for TNOSaprs 1.11.1 and JNOSaprs 1.11.1.

* This is mostly a STABILITY update. I have rewritten the main server loop in the hopes that it will significantly improve the stability of NOSaprs.

* This new release of NOSaprs has CONSIDERABLY less downtime to the APRS internet system. If a server connection is lost or can not be established, then NOSaprs will now almost *immediately* try the next server in the list. The previous versions of NOSaprs had considerable delays between connect attempts.

The kits, documentation, and, binaries can be found at my website below :

http://www.qsl.net/ve4klm/packet/aprss.html

Feel free to contact me if you have questions or need help with this stuff.

890. [aprssig] Kansas City/Independance/Western Missouri WX problems

From: "Kurt Bleich" <kurt_bleich@usa.net>
Date: Thu, 31 Jan 2002 14:10:45
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-60284-2002.01.31-14.41.26--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Good day all,

As you may/may not know, the Kansas City Area has been dealing last night and today with ice related problems. Many folks in that area have no power or other utilities.

The western half of the state has not been showing up for me here in Central Missouri on APRS, and most all the stations that I looked at on findu.com have not made it to the nearest I-gate for several hours.

I have a friend that is heading that way for his employer as he works for a wireless carrier in the area. He has mobile WinAPRS, D700, and a mobile internet connection.

With the exception of the fact he may not have his IP service, does anyone here have any problems/suggestions with him setting up to be an I-gate the next 2-3 days while he is in the area? Might prove to be helpful.

Ideas/Suggestions welcome.

Thanks! 73

... question about PC board layout programs ...

Allan:
I've used two packages (both Windows). CirCAD and Eagle. Neither does simulations. Both have autorouters and will do way more than 4 layer boards. Both have good sets of component libraries, and adding your own is easy in both. Both generate industry-standard gerber and excellon files for sending your work to board houses. The differences:

Eagle is very smooth and clean. The autorouter is fast, and does a good job of post-routing optimization. You can specify in the optimization phase what is important to you through a set of cost weightings. For example, if you wanted to do a 2-level board with no vias, you can assign a large cost to vias and a low cost to some other parameter. If you want traces on the different layers to be oriented differently, you can specify this. I was very impressed with Eagle. For 3.1" x 3.9" boards or smaller, Eagle is free. For larger boards, the cost is somewhere in the neighborhood of $1300.

CirCAD is very smooth and clean for the layout. Its autorouter is out of the stone age though, and takes lots of "personal optimization" to get a good result. For hams, the cost is $300 - significantly less than any of the competitors I know of. The drawings that come out are very clean and nice, in my opinion better than Eagle. If you don't use an autorouter, then CirCAD is definitely the proper choice.

Basically, the extra $1000 gets you the good autorouter. If I did this for a living, I'd spend the money. For "a few APRS projects" its probably not worth it. But if your boards are small enough, then you can use Eagle for free.

73 and good luck.

I posted this message through the TAPR web interface, as I don't recieve
the messages via email, I just monitor via the web.

I imagine that doesn't mean I sent a virus somehow, so I'm doing a scan
with Norton as I type here.

Hi Kurt,

> I posted this message through the TAPR web interface, as I don't recieve
> the messages via email, I just monitor via the web.

Very strange. The alert came up as soon as I checked for mail on my Netscape
mail client, and that post was the only message. There were 2 other messages
in the inbox but they were there already. I had my McAfee download scan
running while I checked for mail.

On a slightly different topic, I'm considering maybe stopping that practice,
cause I just lost my entire INBOX in the process. Arggg !!!!

Maiko / VE4KLM

No alerts here at all.

No attachements came my way, nothing embedded, totally clean ascii near as I can see.

Whatever triggered your alert, I really doubt it was Kurt's post.

Hi Tate and group,

My sincere apologies (so far anyways)... Looks like I have misunderstood the way the McAfee download scan functions. It's very possible that it scanned the entire inbox (which incidently contained a couple of documents that I am currently looking into).

Sorry for the bother. I just wanted to be on the safe side ...

73 Maiko / VE4KLM

ML> Very strange. The alert came up as soon as I checked for mail on my Netscape
ML> mail client, and that post was the only message. There were 2 other messages
ML> in the inbox but they were there already. I had my McAfee download scan
ML> running while I checked for mail.

McAfee and others scan the temporary files created by email programs; if a virus is detected, it is likely that it is NOT a message that makes it to your box, but the one AFTER it, which never makes it to your view.

I found this out when I couldn't download a particular message, but couldn't find out who it was from until I disabled the real-time scanner... Since it was the only inbound message at the time, nothing appeared in my mailbox, but the virus warning popped up each time I did a check for new mail.

I no longer scan inbound mail, because I switched to "The Bat!" as my mail client. Bat doesn't have the same vulnerabilities found in mail clients that take advantage of Internet Explorer and/or Netscape for rendering HTML and Java. I still get virus and worm programs sent to me, but Bat doesn't let them install... and I can scan them afterward.

See my website for some pics of the "gravity-mount" mobile office desk I built for my Passat TDI wagon.
    http://members.aol.com/wa8lmf/survey/survhard.htm

The table consists of a 50lb 5/8" steel plate about 14"x12"that rests on the floor in front of the passenger seat, a small piece of 1/4" plywood covered with Velcro that holds the PC, and a mast consisting of a 24" piece of 1" waterpipe with a pipe flange on each end joining the two. The top of the steel plate is carpeted to match the car; the bottom has ribbed black rubber industrial matting glued to it that completely prevents the assy from sliding around on the car's original carpet.

At the top end, I use what I call "homosexual Velcro". I have covered both the top of the plywood surface, -and- the bottom of the laptop, with the hook-half of Velcro only. This absolutely immobilizes the laptop horizontally, but lifts straight up effortlessly. (Trying to separate half a square foot of conventionally-mated hook and "fuzz" velcro is a real struggle).

The pipe flanges are attached at the left corner of the table and floor plate. The pipe threads into the two flanges fairly stiffly but can still be moved. I can rotate the table top so it faces the passenger squarely, turn it to about a 45-degree angle so it faces the driver, or turn it 90 degrees (so the computer assy is now over the console and shift) that the passenger's lap and legs are completely clear to enter or exit. I drilled two rows of 1/4" holes every 3/4" along the left side of the base plate so that I can adjust the for/aft mounting of the mast to accomodate different cars/dashboards

Speaking of common sense!
```

Since I was the one that suggested the no-skid material to hold things in
place on your dash board, let me make this perfectly clear to anyone who
has sense enough to think for himself..

1) If you are going to have things on your dashboard, it is SAFER to have
it on NON-SKID material than sliding all over the dashboard and in your
lap every time you make a turn, stop or accelerate.

2) #1 above says NOTHING about ENCOURAGING someone to put things on their
dashboard. It is a SAFETY MEASURE that is far safer than NOT HAVING it.

People who do stupid things are going to do stupid things. No amount of
BS on this sig is going to change that...

Bob

If you don't want to build one, I use the Jotto Desk. www.jottodesk.com

It mounts by loosening the front seat bolts on the passenger slide and then
the bracket slides up underneath and is held in place when you tighten the
seat bolts back down. Has a wide ranging articulating arm and is very
sturdy.   I have one in my Suburban. It can be rotated up and out of the
way when someone want to sit in the passenger seat.

It isn't cheap, but it works well for me.

I almost got one of these, but one of my requirements was to be able to quickly place a table into a vehicle that wasn't mine and then remove it again a few hours later. My design is no-holes "gravity mount" -- it stays put by shear weight!

906. [aprssig] Inviting Kids into HAM RADIO!

From: Bob Bruninga <bruninga@usna.edu>
Date: Thu, 31 Jan 2002 21:10:08 -0500 (EST)
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Cc: amsat-bb@usna.edu
Message-ID: <LYR842-60380-2002.01.31-20.40.51--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Last night was our first attempt at getting all the kids in the county on the air on FRS. (Sorry for the post to this sig, but think of it as an "outreach" reminder)...

After giving talks/demos on HAM radio to a number of youth groups (scouts, etc) in the area and then talking about FRS as a starting point and teaching them about callsigns and proper radio procedure, we finally said, ok, at 9 PM on Wendsnday Night, go outside and get your FRS radio as high as you can and see who you can talk to.

This follows several weeks of presentations at Scouts, Kids Radio clubs in the schools, and anyone that would listen... Here are the important points we tried to make to the kids:

1) Put your house on the map with a pin (I had a map board at all mtgs)
2) Always use a callsign (troop/school+initials. Mine is 995REB)
3) Listen first, then call. Take notes on who you hear.
4) Use channel 1 no-tones (or tone=0)
5) NEVER use the callbutton unless you have pre-arranged with someone else
   who is specifically going to be listening for it. But not on our net!
6) Ignore clowns. Don't be one.

Out of the dozens of kids I have reached, never more than 3 or 4 are within FRS range of each other, so this is NOT like a HAM net where everyone in the county can comunicate. The intent is to establish NEIGHBORHOOD nets of interested kids who then spread the word to others. Here is a possible "scenario" that each one of them can be prepared to use on "NET night"...

1) Listen to see that the channel is clear.... PAUSE

2) Is this frequency in use? OVER

3) Is this frequency in use? OVER

4) This is NNNABC calling all radio friends in the weekly "Oak-Grove" Family Radio Service Net. Is there anyone who would like to join the net, please call NNNABC now. Over.

5) Take checkins if any. Ignore all clowns...(if any)

6) The purpose of this net is to establish local Family Radio Service communications nets for meeting other radio friends, for learning about two-way radio and HAM radio, and for local emergencies as needed. We welcome anyone to join us. If there are any new checkins, please call NNNABC now. OVER

6) etc... A third paragraph can suggest how to make up a callsign, etc.

Remember they are going to be lucky to find anyone until we get above critical mass, so each one of them starts as "net control" until they find someone to talk to.

I won't know the results of this first night until next week when the kids report back, but my son and I drove to a hill top and heard two people (not in our groups) very weakly and were able to QSO with one of them...

This won't work until we get to critical mass, but we have now begun. My biggest mistake was forgetting about our own RADIO CLUB! I should have gotten all the HAMS in the county to also join us! That would have doubled the number of people on the air and ALL of them would have used proper radio procedure from the get-go....

Anyway, you might think about "FRS NIGHT" as an outreach program for your area with these "self-interest" objectives:

1) Notice I spoke the full name of FRS. Many users dont know... and the name "FAMILY RADIO SERVICE" lends a certain amount of civility to it...

2) It will get kids on the air and get them hooked on radio!

3) It will teach them proper radio procedures. NOTE, NEVER, EVER admonish ANYONE on the air. You are only there to SET THE EXAMPLE. NOTHIG ELSE. THIS IS IMPORTANT. THIS IS NOT HAM RADIO WHERE YOU CAN PLAY GOD...

4) If HAMS dont show them proper radio procedures, then FRS WILL BECOME like CB and the MARINE BAND. THe BIGGEST MISTAKE THAT THE FCC has made with FRS is in not requiring the radio manufacturerrs to include some kind of OEPRATORS guide in every box! Sure, no one will read it.... but the ABSENCE of such a guide leaves the operation of radio open to the worst possible habits and these CARRY OVER TO ALL FUTURE RADIOS these people will ever use. We see this already on the MARINE band and elsewhere...

Look at part 97. The purpose of HAM radio is to teach the radio art and proper procedures, etc. I don't see any RESTRICTION that we have to limit our responsibilities to only the HAM bands...

Thanks,
de WB4APR@amsat.org, Bob

Now back to your favorite part of the hobby, whatever that happens to be.
Enjoy!

P.S. We chose 9 PM which gives them all time to get home from scout meetings, etc... If they do start making contacts, then you can encourage them to make up QSL cards for their callsigns. It is IMPORTANT for them to IDENTIFY with a call and to become proud of it. QSL cards work... and are fun to draw up on a PC...

A good closing paragraph for your NET would be somthing that mentions your next HAM CLUB meeting... etc...

I welcome feedback and ideas, but to avoid cluttering up the SIGS, send them privately and I will summarize back to the sig if any great new concepts come out of it...

WOW! What a concept... Neat.   And it all fits in a briefcase!

Of course, the internet might be out too, so the flip side of this is to activate his D700 UI-DIGIPEATER (with RELAY and WIDE) and then park on a hill and relay the stuff back to the APRS infrastrucutre that is still working....

CAUTION!!! The jury is still out on the UIDIGI mode in the D700. If you ever set your UIDIGI list to include WIDE, I think I have convinced myself that it will never forget it. Even if you remove it later... YOu may have to do a RESET to clear it. If anyone else has experience with this, let us know...

Rendered body type: text/plain

> Hi Bob. I am in the middle of nowhere in the Arizona desert and I have
> lost my data on PCSAT.

Its easy. For mid-latitudes, PCsat passes occur in two groups of three passes. So if you just happen to hear the first pass of each three, then you will hear two more exactly 100 minutes later... This pattern will repeat the NEXT day 30 minutes earlier.

After about a week, you will need to ratchet to the next orbit to stay in sync, so ADD 100 minutes to the pattern once a week...

Right now in the northern hemisphere, PCsat passes are occuring as follows for the week of 01-31-2002 local sun time:

```
Sats 06 07 08 09 10 11 12 13 14 15 16 17 18 19 20 21 22 23 00 01 02 03

Rendered body type: text/plain

All this wind-bag'n about "safety", "air-bags" and "coffee mugs a fly'n" - I'm pleasantly surprised no one's mentioned any concern about this several hundred pound piece of plate steel fly'n around a passanger compartment durring a collision. Reflect back on some of the past discussions dealing with un-secured or poorly secured batteries get'n tossed about.

Crap - just blew it didn't I...

Kurt,

We're back in business, on the KS side, with good solid copy from WB0HAC-1 and WV0T-9. I've I-gated 226 messages in the last 3 hours.

In the future I can solve this (in my local area anyway) with a portable digi on a nearby hilltop.

Great idea. We should really consider coordinating this in the future.

Wonderful piece of hardware!   You'll want to check the firmware version and upgrade to 5.0 if you're not there.   It does multiple alias and call substitution, etc.

http://www.paccomm.com/

I use mine, with an HT, as a portable digipeater or as a stand-alone tracker. The internal battery make it a great setup.

73!

I know this may sound funny, but is there any sats that have flown with a
SSTV picture in a recording chip ?

I flew one from a kite once, very cool.

Could send the flight patch or a picture of the sat in SSTV form.

Andrew

I dont think it will, but if it is during the day time, then PCsat may be
usable and you will certainly be authroized to use it. Also, do you know
we are designing the next starshine. See my starshine WEB page...
It will be a PCsat clone...

Rendered body type: text/plain

```
In DOS APRS, the icons DIM out after the DIMOUT TIME. and disappear
after the TIMOUT.

In WinAPRS and MacAPRS, since we use fancy colored ICONS, the DIMOUT
didn't make  much sense because the display on the icon's wouldn't
look any good..

In MacAPRS, I made the station lists show the text in ITALICS if they
were 'dimied out' and then tried to do the same thing in WinAPRS.
The italics in Windows was very tough to read on most computers, so
we stopped doing that too.

Keith

> doesn't seem to affect the length of the line.

The length of the DF line is done autmoatically for you in APRSdos by
assuming your current map view (range scale) is valid for the DF you
are performiming... that is that your expectations for the location of the
source all fits on the current map scale.  Thus the DF bearing line is
given a length proportaional to that originating map view.

This is transmitted in the DF bearing line format so that all recepients
are supposed to display it to the same real-world length so that the
recepients are given a clue as to how far out the originator intended for
his DF line to be valid.

> In WINAPRS the distance seems to be fixed at x inches.  This doesn't
> work when you get a little way from the starting point and try to zoom

9. [aprssig] Nice GPS article - thin but interesting

From: "Sadowski, Allan" <allan.sadowski@ncshp.org>
Date: Mon, 1 Apr 2002 16:44:26 -0500
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-71794-2002.04.01-16.08.47--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

It's not a bad article on GPS - I recall paying $3000 for my first GPS receiver about 12 years ago... a monster Magellan that ate up 8 AA batteries in 45 minutes.... so they have come a long way...

I'm looking forward to the stuff a bit further out on the GPS event horizon... second Civilian channel to reduce ionospheric propagation errors... low cost multiGPS "platforms" that gives me high dynamic condition updates (pitch roll yaw positions... as well as accelerations in all three axis). And one of these days there may even be pseudo satellite systems that have enough power to be useful in concrete canyons... and with enough power to be useful inside buildings... now that will be a revolution...

Is there a program that will allow one to manually decode this data. I'm aware of the telemetry program but would like to be able to enter the values manually as I don;t always monitor the PCSAT's downlink.

Thanks!
Ryan

11. [aprssig] Handipacket Stand-alone tracker..HELP!!!

From: "Robert M. Butts" <kb5yqh@arrl.net>
Date: Mon, 1 Apr 2002 20:26:52
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-71829-2002.04.01-21.00.08--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Seems that I've developed a brain cramp...

I can't seem to get my handipacket to read NMEA data.
(Firmware version 5.0 - digi works great!)

Keeps spitting out "Waiting for GPS data" as the LTEXT.

Must be missing a step. Here's what I've got:

1. I set the baud to 4800, N, 8, 1 (using a modified TripMate - and YES it spits out NMEA sentences just fine to Hyperterm set @ 4800).

2. GPSTEXT $GPRMC
3. LOC E 120 (2 minutes)
4. LPATH APRS VIA RELAY, WIDE
5. GPS ON

Unplug the computer...plug in the GPS (that you just unplugged from the computer to verify it was receiving).

That SHOULD do it...shouldn't it???

Well, it didn't :)

Thanks in advance...

Bob, KB5YQH@arrl.net

Rendered body type: text/plain

```
Well, if you're gonna interview someone about GPS, Per Enge is certainly
one of the folks I would go looking for.  A professor at Stanford, he's
one of the real key folks in technology development.  And a real sharp
individual.

My first receiver was a Trimble board-level unit, a 3-channel sequential
scanner, offered by a friend.  It came with documentation, supplemented
with what I could find on the Web, the Interface Control Document and
Signal Specification.  It really wasn't good for navigation, and was
designed originally for geodetic (or, really, GIS) work, but it was a
great teaching tool.  AA batteries?  More like a car battery for about 8
hours.

L5, the new civilian channel, will be seen about 2005.  DoD really ARE
our friends, funding the engineering changes when Congress got confused
and didn't do so directly.  The improvement in ionosphere mitigation
will be more acute for the geodetic users, but improved models may allow
better model data transmissions (and mods to the Signal Spec, with
regards to Almanac) associated with the deployment of L5.
```

Fugro Group made a 3-axis sensor for moderate dynamic conditions with 4 Trimble SVee6 receivers, then followed it up with some OnCore receivers. Both of these were in-house research projects for a special application. To the best of my knowledge, they never evloved it into a project, but Ashtech, Trimble and Javad all have commercial sensors at the 10 Hz rate. The math's pretty straightforward, and the issue is a single reference receiver in the array, and 3 used to calculate real differences between the reference and the outriggers. Then it becomes plane geometry. And physics, and calculus.

A friend from my NASA/JSC days (and one of Enge's PhD graduates) is heavily involved in pseudollite design and implementation. They already exist and are in use for LAAS, some military apps, and some aviation apps, mostly densifying approach data in difficult areas. In building systems are accomplished already with reradiation of GPS signals, pedometers, accelerometers and other strap-down inertial systems.

And, I agree: getting the received signal level up to where it doesn't require a preamp that'll warm your tooth fillings would be a good thing, if somewhat difficult when one starts thinking about spacecraft power budgets.

14. [aprssig] PCSAT - Telemetry Query

From: Ken Collins <g4fip@btinternet.com>
Date: Tue, 2 Apr 2002 07:57:48 +0000
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-71866-2002.04.02-02.32.58--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I saw this message on PR today:-

"Hi, PCSat-Experts,
can somebody please tell me, what the meaning of these
digits in PCSat-Telemetry is?

```
T#xxx,xxx,xxx,xxx,xxx,xxx,11111111,00xx,1 "
                                               ^^^^^^^ ^^     ^
```

I do have a copy of the Telemetry Analysis document, but it doesn't cover all of the digits arrowed above. Although I know some of them, I would like to provide a fuller answer.

Thanks for any help!

15. [aprssig] findU web pages update

From: Steve Dimse <k4hg@tapr.org>
Date: Tue, 2 Apr 2002 04:53:12 -0500
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-71867-2002.04.02-04.26.32--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I've done a lot of work in the last couple days on the findU web pages.

First, I've created a new feature page, where I highlight whatever new things I've done lately.

http://www.findu.com/new.html

There are stories about the "Cracker Tracker" and a mobile geo-cache, new zip codes for many countries (including a previously unannounced way to get Australian zip codes), and the stream monitoring tool.

Another new feature is that the radar-find cgi can now extract just a portion of the image around a given position...I'm using this to send a radar image to my truck using the Earthlink AVL I won. I can't wait to see how this works on my Baltimore-Dayton-Charlotte road trip in May!

I hereby swear I will keep the new page up to date, so this is THE place to watch if you want to find out the lastest and greatest on findU.

I've also done a lot of work on the cgi.html page, a lot more of the cgi's are documented, some errors are fixed, and I hope to have all the cgis documented in the next week or two.

http://www.findu.com/cgi.html

Steve K4HG

16. [aprssig] HandyGPS (Pro) with PocketAPRS?

From: Hamish Moffatt <hamish@cloud.net.au>
Date: Tue, 2 Apr 2002 21:16:22 +1000
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-71868-2002.04.02-05.49.39--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Is the Nexian HandyGPS (or the Pro model) supported with PocketAPRS?

The PocketAPRS web page says "The hardware is not compatible with other software packages.", but the HandyGPS Pro FAQ (at www.nexian.com) says

Q2. Does HandyGPS work with other software products?
A2. Yes, the HandyGPS Pro is compatible with other mapping
    software that is NMEA-0183 compatible..

Anyone tried it?

thanks,
Hamish

I think if you are plugging the GPS into the same
connector you are usign to program it with the
computer you will have to use a null modem cable or
build your own.

Basically what s happening is the GPS's tx line is
trying to talk to the computets tx line. same for rx.
the null modem will allow the tx of one to talk to the
rx of the other and vice versa.

Radio Shaft should have somehting like that in stock.

Run PCSAT.EXE and the telemetry graphics page has a graphics window
that shows the state of each bit and what each bit  represents...

 0xxxxxxx = UHF RX A OFF
 x0xxxxxx = UHF RX B OFF
 xx0xxxxx = GPS ON
 xxx0xxxx = Reset the other TNC
 xxxx0xxx = Clear the 72 hour fail safe hardware timer
 xxxxx0xx = A = Up B side power by 2 dB. B = Select MITEL or NMEA GPS data
 xxxxxx0x = Turn on LEDs (80 bright red LED's on -Z face)
 xxxxxxx0 = Activate 10 second synchronizer (PTT only once in 10 secs)

 1xxx     =  Activate battery isolate relay
 x1xx     =  Activate Transmitter isolate relay
 xxNN     =  00,01,10,11 Telemetry Frame Counter.

```
There was a posting recently that suggested the new Garmin Street Pilot III
(color) would not process APRS stations on the GPS map, when fed by a
TM-D700 or TH-D7A.

It does, does it nicely, and in living color.

Screen refresh is transparent, unlike my old Garmin III+, which would
continuously blink while refreshing.

List price of the Garmin Street Pilot III is $999.00, but ecost.com has them
for around $740. That's where I got mine.

I remember reading on one of the lists that some model or other of
Street Pilot didn't have the feature, but it was added or was to be
added in later models.  In this case, be careful when buying a used
one for APRS unless you can flash-upgrade it to newer firmware.

Any and all of them that allow setting different datums, should reflect
the output in the datum selected, as Garmin does.  Thus, error
propagation.

23. [aprssig] ADMIN: Monthly Reading of the Riot Act

From: Stan Horzepa <stanzepa@earthlink.net>
Date: Tue, 02 Apr 2002 20:46:34 -0500
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-71954-2002.04.02-20.23.10--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

(This message is posted on the APRSSIG on a monthly basis.)

PURPOSE

The purpose of the APRSSIG is to provide a forum for folks interested in
discussing APRS, in general. (Other TAPR SIGs are available for discussing
specific APRS topics, for example, APRSSAT for APRS satellite applications.)

POSTING MESSAGES

To post messages to the APRSSIG, send email to aprssig@tapr.org

APRSSIG RULES

The APRSSIG has a few simple rules:

. Be courteous. Abusive, insulting, or rude behavior demonstrated towards
another list member is a violation of this rule.

. Stick to the subject, i.e., APRS. Subjects that are only tangentially
related to APRS (like ³what kind of car should I buy for my APRS tracker?²)
may be considered off-topic. If you start a message with ³this is
off-topic² then you are violating this rule.

. Be succinct when composing a message. (The APRSSIG software has been
optioned to limit the length of each message.)

. When quoting a previous message, only quote the parts of that message you
are referencing. (The APRSSIG software has been optioned to limit the length
of a quote.)

. Do not send messages in HTML of Rich Text format.

. Do not send attachments.

. Cross-posting is not permitted. (The APRSSIG software has been optioned
to prevent cross-posting.)

. The APRSSIG administrator reserves the right to suspend or ban any list
member who violates these rules.

SUBSCRIPTION MAINTENANCE

You may make changes to your subscription (like change your email address, toggle on/off the digest mode, etc.) by logging into the APRSSIG at http://www.tapr.org/cgi-bin/lyris.pl

UNSUBSCRIBING

To unsubscribe from the APRSSIG, follow the directions you will find at the bottom of each message you receive from the APRSSIG.

QUESTIONS, COMMENTS, ETC.

If you have any questions, comments, etc. concerning the APRSSIG, please email the APRSSIG administrator at the address below.

Stan Horzepa, WA1LOU, wa1lou@tapr.org

24. [aprssig] Custom Map Scripts

From: "Brent Hildebrand" <bhildebrand@earthlink.net>
Date: Tue, 2 Apr 2002 19:41:14 -0800
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-71962-2002.04.02-22.15.05--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

APRS+SA Custom Map Scripts.

These are scripts that can be created to plot data based on the criteria you specify. There are a number of functions and criteria you can use such as Latitude, Longitude, Range to a specific station or Lat/Long, station Icon, posit text search, and others. These can be combined in logical expressions, and/or numerical comparisons.

Here is a sample script. Lets say you wanted to show only stations that were in Iowa. You can create one that looks only at Lat/Long. Here it is:

```
(Long > -97) And (Long < -90) And (Lat > 40) And (Lat < 43)
```

Here, there is a numerical comparison to check to see if Longitude is > -97, logically combined with Longitude < -90, then combined with the Latitude range. Only stations in this range will be plotted. Others will be excluded. Here the "functions", Long and Lat are the numerical values of Longitude and Latitude of stations APRS+SA has decoded. The function And, performs the logical and function. Note, text case is important in function names, and callsign arguments.

Another numerical function is the RangeTo function. RangeTo takes a right argument of a station callsign, or a Latitude/Longitude pair. And example might be as follows:

```
50 > RangeTo 'KH2Z'
```

This would plot stations less than 50 miles from KH2Z, provided the location of KH2Z is known. The follow script would plot stations less than 50 miles from the coordinates of 34,-117. Note the comma, which is necessary.

```
50 > RangeTo 34,-117
```

RangeTo can also have an argument of '' (2 single quotes) which means your current location.

```
50 > RangeTo ''
```

Summary so far, Logical functions:
And
Or
Not
Xor

Numerical functions:
Lat
Long
RangeTo

Another function is the From function. This looks at Position data from the specified station(s). Several stations can be specified, and wildcards can be used. Example, this would include positions from KH2Z-9, and all variants of N9XTN.

```
>From 'KH2Z-9' 'N9XTN*'
```

The search function, To, will example the Unproto To for a string match. The following will search for the unproto To of APS211.

```
To 'APS211'
```

Searching for a portion would also work:

```
To '211'
```

Or, the following will pick out most APRS+SA stations:

```
To 'APS'
```

The Text function will search for text strings in the Posit text of stations.

```
Text 'APRS+SA'
Text 'PHG'
```

The last function I will discuss is the Type function. This one can be used for a number several types of searches.

The following searches for the digipeaters GATE and ECHO in the path
```
Type 'HF'
```

This one searches for stations that are listed in the IGate tab of APRS+SA, meaning that they have transmitted an IGate packet and has been decoded by APRS+SA.
```
Type 'IGATE'
```

The TRACKER argument looks for all NMEA string position reports.
```
Type 'TRACKER'
```

The IGATED argument looks for the last position as having been transmitted via an IGate.
```
Type 'IGATED'
```

TRACKED will show stations in your tracking list.

A little trickier is the ICON argument, It requires a second, left argument.

```
'*&%'  Type 'ICON'
```

Note, is you want to use the digipeater symbol, you need to enter it twice. Why? Because that is the way I programmed it!

```
'##*&%'  Type 'ICON'
```

Or for those stations claiming to be digipeaters, enter:
```
'##'  Type 'Icon'
```

Or, just:
```
Type 'DIGI'
```

So the right arguments to Type are:
```
'IGATE'
'TRACKER'
'TRACKED'
'IGATED'
'HF'
'ICON'
'DIGI'
'OBJECT'
'Mic-E'
'D7'
'WX'
```

In the Custom Map Editor, there are several options. A time filter which will only look back the number of hours specified. Also, the History check box will enter the callsigns of stations found into the History tab of APRS+SA. The Delete Posits button will delete stations who match the criteria of the script. The Keep Posits that Match does the same thing when the map is drawn automatically, providing another way to trim the data you keep stored in the active internal Tactical Database.

To find IGates with in 100 miles of N9XTN, you might use the following Map Script.

```
((Type 'IGATE') And 100 > RangeTo 'N9XTN') Or From 'N9XTN'
```

To find the digipeaters with in 100 miles of N9XTN, try:
```
(('##' Type 'ICON') And 100 > RangeTo 'N9XTN') Or From 'N9XTN'
```

Show Quake objects:
('Q' Type 'Icon') And Type 'Object'

Once you have created your script, you can save it to a name you specify. The new name can have its own MOP file (Map Options). The new map can have its own overlay file to add drawing objects to the final map.

There are a number of possibilities. If you create a favorite, let us know.

25. [aprssig] Help with APRS Spec

From: "Andrew Rich" <andrew.rich@bigpond.com>
Date: Wed, 3 Apr 2002 20:16:55 +1000
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-72003-2002.04.03-04.49.14--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Gents,

I want to create a APRS replay program.
It saves up all the packets heard and then replays 24 hours on demand.
Can someone help me with the APRS "third party packet format" ?
The APRS spec seems to say "strip off all after the * "

If I heard:-

```
VK4TEC-9>RW34Q4,VK4GME-3*,WIDE <UI R>:'Q]GoK+>/]"4O}TM-D700
```

And I wanted to "replay" this later, would it be:-

```
VK4TEC>APRS,RELAY <UI>:}VK4TEC-9>RW34Q4,VK4GME-3* <UI
R>:'Q]GoK+>/]"4O}TM-D700
```

Rendered body type: text/plain

Thanks to Johann Lochner, ZR1CBC, we now have a full orbit model of the solar angles of PCsat with its assumed magnetic stabilization. As expected, PCsat is through the worst (about 1 APril) and will be peaking around 20 APril. Lets hope there is enough capacity in the batteires remaining to take advantage of it.

See the new plots and analysis on the PCsat WEB page..

27. [aprssig] swift weather software avail

From: RWendel@aol.com
Date: Wed, 3 Apr 2002 20:18:02 EST
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-72174-2002.04.03-19.51.39--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

In case some of you mobile trackers are into weather stuff, http://www.swiftwx.com has now launched its weather mapping and radar software. You can run it at home (without GPS), or use it mobile if you have mobile-internet access, plus you can run your GPS and spot your location in relation to the radar/storm as you are out spotting. It's pretty slick...I run mine at home just to keep updated radar maps, and you can pre-determine auto download time intervals of your pre-selected radars, satellite, and analysis maps. You can purchase the download or order the CD and immediately download the software while it's being shipped. It's pretty slick.

28. [aprssig] anyone using 802.11b?

From: "Bob & Janet" <jbcraft@adelphia.net>
Date: Wed, 3 Apr 2002 21:46:19 -0500
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-72190-2002.04.03-21.28.37--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

OK, so this MAY BE off the topic of APRS... but... what I want to do with it IS on the topic.

First, before some well meaning soul flames me for asking, I want you to know that I just recently (yesterday!) rejoined this group after a 7 or 8 month absence. I heard that some one has been experimenting with 802.11b WAPs.

I would like to start a WAP in this area. I was thinking that placeing 2.4GHz AP's in stratigic locations (water tanks, towers etc) perhaps even solar/battery powered, that the local EMA types could use VoIP, APRS, HTTP, FTP etc inside the WLAN and even go as far as to put one AP on the internet for remote access to real time information.

The question that begs to be asked by me is; has anyone done this yet, if so, what equipment is being used, how hard was it to modify the FCC Type15 antenna to an antenna with some gain?

Ideas? Suggestions, WARNINGS?

802.11b... I see mentions of Orinco and Linksys WAP11. I've used FreeWave, Wavelan, Xircom and Raylink. Hoping to buy some WAP11's this weekend. It (the wap11) seems to be a real hacker's box (maybe because it has a atmel in it? (just checking to see if dave is reading))

> how hard was it to modify the FCC Type15 antenna to an antenna with some gain?

You replace them and also decide if you want to operate under Part 15. Most everyone stays under part 15, even the hams, because the part 97 rules are so restrictive and really don't buy you anything because of the ARRL/Metricom Axis alliance.

Comet and Superpass come to mind as good antenna makers.

A simple google search should point you in the right direction.

Seattle Wireless, practicallynetworked.com, BAWUG, NoCatNet should get you started.

Modifying antennas is not necessary if you buy Access Points or Wireless NIC's that have removable antennas or antenna ports on them. Gain 2.4 GHz ISM antennas can be bought at Ham Radio Outlet among other places.

My favorite supplier: http://fab-corp.com/

I'm using 802.11b for APRS and home automation currently. 802.11b VoIP is still out of the mainstream just yet. I had two Symbol 802.11 telephones for a while and they were a kick, but the price tag of about $800 EACH makes them a very expensive toy. Plus an H.323 to POTS gateway is hard to find and also very expensive. I have used NetMeeting over 802.11b with fairly good results. I can hardly wait for somebody like Panasonic, Uniden, or Sony to release a cordless 802.x phone for the masses

I'm using Linksys WAP11's for AP's and ORiNOCO Gold cards for clients with good results.

Our own fearless leader, Stan Horzepa, wrote an article a while back for
QST about 802.11b...

Do a Google search on "Pringle's Can Antennas". Really. People are building
high-gain wave-guide and ring-yagi antennas for 2.4 GHz 902.11 links out of
Pringles Chip cans. One such article claims they are getting 9-12 miles
line-of-sight between two such antennas...

What kind of range are you getting out of these and can you describe you
setup? (stock antennas or externals) I've heard pro and con on the BAWUG list
on these but what was attractive to me is they are cheap and can function as
both a AP and also the client end. Like the ethernet in and was thinking of
doing a power over ethernet so I could mount one high up on the tower.

>My favorite supplier: http://fab-corp.com/

Thanks for that link. They have the best prices on the Comet FP-24 I have
seen so far... $169 where as HRO wants $199

It's a slick package, and I've already discussed APRS support with the
author. It's in the development plan.

Also, you are explicitly allowed to put it on multiple computers.
It's on my desktop permanently, and I'll run it on my laptop when I go mobile.

Hello Ken,
YES, indeed, these informations do help.
Now I can finish up the work an a PCSat-telemetry-decoder
which I am programming together with some students at a
nearby school. The young people (age 14) try to understand
some of the satellite techniques.

Of course, there do exist telemetry-decoders already, but
either they use TNCs (PCSAT.EXE) or they require WinXX-
machines (UI-View).

In our case, we wanted to use KISS-protocol modems (AS52
for 1k2 and AS96 for 9k6) and also learn a lot about AX.25-
packet-radio-encoding.

Thank you for your help!

73, August

PS. I have no regular access to the Internet.
May I invite you, to visit
www.aatis.de
www.amateurfunkjugend.de
www.funktreff.de and there -> DL0PVD
?
Here you find the activities that I have the honour to
assist. Unfortunately all in german language, but some
of the phrases around amateur radio stuff may look
familiar anyway. :-)

Rendered body type: text/plain

Hey Bob,

There's a great discussion of this going on right now on qrz.com.

It's "Inexpensive high-speed packet is here".   I recently ordered some high-gain antennas and cables with reverse-polarity TNC connectors (to fit a Linksys WAP) from an ebay store. The whole setup (2 WAPS, 2 antennas and 2 cables) was less than $350.   The 1st 6 channels of 802.11b overlap the ham bands so (the current interpretation of the regs is) you can boost the ERP out of part 15 limits. Part 97 regs have become fairly liberal.

http://www.qsl.net/kb9mwr/projects/wireless/clarify.html

Anyway, some folks have achieved 20 miles with 20+ db antennas and < watt.
So far, with my setup, I've haven't quite hit 10. LOS is critical! Anyway
it makes a GREAT highspeed TCP/IP link for APRS. You can easilly use
existing APRS software.

Here's some links to the TONS of info out there on this subject.

Here's the frequency map:
http://www.qsl.net/kb9mwr/projects/wireless/dssfreq.html

There are TONS of info files in this folder:
http://www.qsl.net/kb9mwr/projects/wireless

http://sdots.com/wireless/build.html

This CERTAINLY has the potential to take off soon given the decreasing
costs of the commercial (part 15) gear. Mobile and portable systems are
easily possible as is VOIP and LAN/MAN/WAN application. Wow!

We're really fortunate (for once) in some ways that this stuff shares the
2.4 GHz band. Never thought I'd say THAT <G>.

73!

Bob, KB5YQH

> R>:'Q]GoK+>/]"4O}TM-D700

"<UI R>", "<UI>" etc are not part of the packet, they are being
inserted by your TNC when it receives those packets. So you
should not transmit them in the replay.

For that matter, so is the FROM>TO format; they are seperate
fields in the AX.25 header really.

You would actually be hearing

VK4TEC-9>RW34Q4,VK4GME-3*,WIDE:'Q]GoK+>/]"4O}TM-D700

so you should retransmit

VK4TEC>APRS,RELAY:}VK4TEC-9>RW34Q4,VK4GME-3*:'Q]GoK+>/]"4O}TM-D700

I think. I haven't checked the spec. My point was that the <UI>
parts are not really there.

That is cool software!
Do you have to have any other subscriptions for the radar (such as
weathertap, etc.)?
What about over laying other positions? Could this be done manual or
better yet...maybe a APRS feed on top of this? Would be cool if you
could parse out certain stations and have it automatically overlay it!

In case some of you mobile trackers are into weather stuff,
http://www.swiftwx.com has now launched its weather mapping and radar
software. You can run it at home (without GPS), or use it mobile if you
have
mobile-internet access, plus you can run your GPS and spot your location
in
relation to the radar/storm as you are out spotting. It's pretty
slick...I
run mine at home just to keep updated radar maps, and you can
pre-determine
auto download time intervals of your pre-selected radars, satellite, and
analysis maps. You can purchase the download or order the CD and
immediately
download the software while it's being shipped. It's pretty slick.

Well, in an effort to utilize APRS at the annual 'Lewis & Clark Adventure Race' event and to announce the event, I made use of the ANNOUNCEMENT capability on winAPRS. The Race involves more that 50 teams of 4 persons each, over a course of 100 miles in which the racers do Orienteering, Canoeing, Rock Climbing, Rappelling, Mountain Biking and Running over a 36 hour period. Ham radio, and this year APRS, is the BACKBONE of Communications for check points and Emergency Services. Apparently, utilizing APRS to recruit help is not acceptable? Politically correct?

See below:

On Tuesday Joseph F. Thiel, n5smn@sbcglobal.net, writes:

Jeffery, suggest you should send out APRS Bulletins to local RF stations only, not everyone connected to the aprs.net servers. Most people have no need to see 19 or more, e.g., BLNA thru BLNU, lines of 'Bulletins' on their system in other parts of the world.

To which I reply:

I can't control that.

To which Joseph F. Thiel, n5smn@sbcglobal.net, responds with:

I have added W5JSR-10 to the 'Ignore ALL packets' list in the Austin, TX IGATE.

I guess ABC has it right! We have become rude people! If a few little bits of information get people to fly off the cuff and start micro-managing this hobby, BUDLISTing and complaining, well, that is the end of it!

Oh well, I will continue to use APRS via RF as I have for almost 10 years now, and those of you who don't like it, well, you know where you can stick it!

Oh yeah, if your in Austin, TX, well, maybe there is an IGATE that needs to be BOYCOTTED!

73's to all!

Sounds like Joe, is a bit of a "rear end".

If you did not send it to his I-Gate then he ought a be smart enuff
to figure out who did. It takes smarts to operate a 'puter to do things
other than EMail and surfin'.

I do all my stuff, even PBBS on RF, 'cuase that what a
ham ticket is for.

I would not worry about him lockin' you out since you did not
send it to him anyhow.

There all sorta folks in the world and ham radio is no different!

Read "unfortunate" if you are active and/or interested in Amsat Oscar 40
where these marauding Part 15 devices completely trash the AO-40 Downlink on
2401 Mhz. It's interesting that they are supposed to be restricted from
causing or suffering from interference from a licensed service like ham
radio, but the powers that be are afraid if push comes to shove with the FCC
over enforcing this non-interference rule from/to Part 15 devices that the
FCC will merely change the rules and we could lose the band entirely. Talk
about encroachment! Now the rules mean nothing...it's all about numbers.
There are a ton of 2.4 gig Part 15 devices/users out there and only a
smattering of hams, so the rules don't mean a darn thing.

The result is our only resource on AO-40 has been severly compromised by the
"fortunate" use of 2.4 gig Part 15 devices. Between these Part 15 Devices
and Pave Paws radar, AO-40 has its hands full. Hardly anyone in the
satellite community is celebrating, I can assure you.

Where did you learn this?

Weather.gov simply points to http://www.nws.noaa.gov/ and unless I
missed something, I see no mention of the fact that the iwin site is
going to disappear, not even on the iwin web site.

In case you aren't aware, this capability exists within findU:

http://www.findu.com/cgi-bin/radar-find.cgi?call=*&radar=byx&zoom=3

I used the zoom so the stations spread out a little. You can also cut a portion

```
of the image surrounding a station:

http://www.findu.com/cgi-bin/radar-find.cgi?call=k4hg-8&offsetx=200&offsety=200&
zoom=3

and even hide the station so as not miss any of the data:

http://www.findu.com/cgi-bin/radar-find.cgi?call=k4hg-8&offsetx=200&offsety=200&
zoom=3&nocall=1

Rendered body type: text/plain

```
Also, http://findu.ae5pl.net can map stations on NWS radar maps (select
"Stations Near on Weather Radar") using javAPRS.  The stations are
plotted from a live Internet feed and javAPRS downloads a new radar gif
every 5 minutes (the maximum rate that the NWS updates the gifs).  You
can also tell javAPRS to display only specific stations.

javAPRS can place live reports on any gif or jpeg.  This is how it plots
on NWS radar, MapBlast, and Expedia maps.

802.11b effectively has three non-overlapping channels...  1, 6, and 11.   As I
understand it, without doing definitive research, 1 is completely in the ham band.
Channel 11 is completely outside it.   I'm setting my own 802.11b equipment to channel 11
and I'm requesting that other local users do the same - when feasible.   Use of
channel 11 should at least reduce the interference to the AO-40 downlink.
```

It's fascinating watching the local 802.11b network group, http://www.seattlewireless.net,
working through and relearning the same networking lessons we amateurs did with TCP/IP
on RF in the past 5 to 10 years. Things have changed.   Now they have cheap equipment,
incredibly higher speeds (11,000,000 bps vs 1200 bps APRS) and none of the silly regulatory
restrictions.

It's incredible watching the efforts and attention to detail these non-RF hobbyists are
going through to get good RF signals. They're building working miliwatt Microwave systems.
Way cool!

802.11b is an incredible complement to Amateur data...   It gives full speed connectivity
for that last "100 feet" to the Amateur system.   One of the fellows in the local wetnet group,
(Amateur TCP/IP networking - http://www.wetnet.net) has a full linux server in his jeep complete
with 802.11b hub, 144.39 APRS radio and TCP/IP connectivity to the Internet on UHF packet.
I installed JavAPRS on the hub.   Several of us were in the cafe, using 802.11b to connect to
the hub, watching local APRS traffic on JavAPRS. Several others were using Xastir to connect,
via TCP/IP on 802.11b, to APRSD on the hub for their APRS connection.

73,
Bill - WA7NWP

PS. The much touted Pringles Can antenna has been found to be much overrated. Other
cans have better metals and physical sizes..

Is there any reason that WINAPRS ver 2.5.1 is not decoding the following
position packet when versions 2.4.9 and earlier do?

```
W2RGI*>W2RGI>ID:TheNet X-1J4  (OTSEGO)
!4226.15NT07500.40W#PHG5850/WIDE-RELAY...Otsego County APRS Digi - Oneonta
```

Maybe I'm just missing something, but was concerned there might be a bug.

Thank you,
Brian N2KGC

I just got the new Ramsey catalog in the mail today, and it has a page dedicated to 2.4G network extention antenns. One omni antenna, and two dishes... He even sells an adapter for Linksys and Cicso equipment to hook to standard N fittings.

55. [aprssig] NOSaprs 1.12 is ready with brand new documentation

From: Maiko Langelaar <maiko@slmsoft.com>
Date: Thu, 04 Apr 2002 15:35:41 -0600
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-72333-2002.04.04-16.13.31--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Greetings,

I am pleased to release NOSaprs 1.12 to the masses, with brand new documentation in HTML, RTF, Word, and PDF formats.

NOSaprs is an APRS Server and Internet Gateway (Igate) integrated into the NOS itself. Those people already running JNOS or TNOS gateways can easily start to support their local APRS community by simply compiling in the new services, or by getting a NOS binary that contains the new services. Then it's just matter of adding a few extra commands to the autoexec.nos file.

Use an existing RF port (to create the ultimate zoo channel), or add a new RF port for 144.390, or add multiple RF ports to take care of more than one frequency, or use 9600 baud or higher, or use AXIP or AXUDP to grab APRS data from other internet gateways around the world. The NOS environment has the potential to provide a wide variety of options.

For complete information, update kits, documentation, and other stuff, please visit the official NOSaprs website at the following URL :

http://www.qsl.net/ve4klm/packet/aprss.html

I have loaded palm aprs on to a Palm M500. I have interfaced a GArmin 45XL GPS to it. I know the gps is talking to the palm as I see the data from the gps on the terminal screen. I do not see my location on the screen. Is it possible to see yourself on the screen using a gps only?

57. [aprssig] KISSGEN, another Cybiko friend

From: Alex <kr1st@amsat.org>

Rendered body type: text/plain

Hi there,

I wrote a little Windows (Win32) command line program that generates
KISS frames from a file containing TNC-2 type frames. These KISS frames
are being sent to a serial port at a certain interval. The user can
specify which port, the speed and at what interval the frames need to be
sent. I needed this to test my Cybiko applications and thought others
may benefit from it, too.

You can download KISSGEN (free, of course) from my web site at:

http://www.qsl.net/kr1st

Thanks and 73s,

Don't tell Darwin Networks that. If you willing to put a little effort
into tracking them down, the FCC will do something, although I suspect
it has to be a griveous case. Going after the teenager on the 2.4ghz
cell phone is going to be tough.

> ERP out of part 15 limits.

For point to point part 15 on 2.4ghz there is no hard ERP limit. Check
it out yourself if you don't believe me. The FCC has a formula for PtP
links.... for every 1db power below 30dBm (1 watt) you go, you can add
3 db of antenna gain to the allowed 6db (at 1 watt). So for your 100mw
Linksys (20dBm) you are 10 db below 30dBm, which allows you to add 30db
gain to the 6db gain allowed... a total gain of 36db for your antenna
which would give you a ERP of 56dBm (20+36) or 400watts ERP on part 15.

For point to multipoint, the limit is 36dBm (4 watts erp).

>Part 97 regs have become fairly liberal.

Not really. We can't run over 1 watt on han spread spectrum unless we
implement automatic power control. While we got the ability to use any
spreading codes we wanted (which allowed us to use Part 15 gear) we
also got our power limit reduced to the same as Part 15 gear unless you
implement automatic power control.

Still quite a bit you can do with it though.

73

>Thanks for your time,

Well for one, the term, "getting the axe" means something. It means terminated, ended, finished, chopped down...

From what I see, they're just renaming their official site to something more simple, actually intuitive. Something that's easier to remember and to type. That's hardly "getting the axe."

Furthermore, why would anyone complain about this? Oh no, I'll have to change a bookmark! I'll have to type less characters to go directly to a web site. I'm gonna write my congressman about this... That darn government simplifying things and making it easier to get information....

Well now, I find this interesting and have had reason to be pondering it already. I have an 802.11b wirelss network on my wired network here at home, and, am in the process of gearing up for AO-40. I spent some time talking with our local AMSAT coordinator who is very active and very knowledgeable. He was of the opinion that a well setup downlink receiver/antenna combo should be at worst minimally influenced since you are pointing a high gain antenna at the sky. The noise floor on 2.4 G would be raised somewhat if your laptop had a wireless card plugged in sitting in close prximity to the antenna,first conversion area.

just my $.02 ... bbr, n1bq

Read "unfortunate" if you are active and/or interested in Amsat Oscar 40 where these marauding Part 15 devices completely trash the AO-40 Downlink on 2401 Mhz. It's interesting that they are supposed to be restricted from causing or suffering from interference from a licensed service like ham radio, but the powers that be are afraid if push comes to shove with the FCC over enforcing this non-interference rule from/to Part 15 devices that the FCC will merely change the rules and we could lose the band entirely. Talk about encroachment! Now the rules mean nothing...it's all about numbers. There are a ton of 2.4 gig Part 15 devices/users out there and only a smattering of hams, so the rules don't mean a darn thing.

The result is our only resource on AO-40 has been severly compromised by the "fortunate" use of 2.4 gig Part 15 devices. Between these Part 15 Devices and Pave Paws radar, AO-40 has its hands full. Hardly anyone in the satellite community is celebrating, I can assure you.

It's nice to see the experiments with 802.11xx equipment.

BUT: Europeans be aware: Most of the european telco authorities decided,
that is *not* legal to use WLAN devices in ham band segments! Because it is
not a legal mode for hams and it is not legal to boost the WLAN devices to
higher power !
We noticed an very fast and high increasing of noise on 2.4GHz around the
satellite downlink frequencies.
So please think about this circumstances when you intend to use such WLAN's
for ham purpose or near space frequencies!

```
The ones on the SIG that know me know that since 1996 I have had a
bootlegger using my callsign on 2 meter, HF and even CB also on APRS. I have
also had my name used to open many accounts on the internet. I have looked
```

to many goverment agencies for help and recieved very little. So I have
created a web site to cronical the events that have lead to the theft, the
things that have happened due to the theft, what each goverement offical and
agency has done and where I stand now. The site is at
http://www.geocities.com/any_justice The reason I bring this to the SIG is
the bootlegger was a fellow ham, he once was a member of this SIG. I am
trying to let people know that if you don't protect yourself on-line and in
real life you could end up a target too. If this may interest you please
visit the site. If not then I am very sorry I have wasted your time.

73 and thanks for the use of the SIG,

Brian,

If you read the amsat-bb list, you will find that things aren't as "ducky"
as your friend indicated. Two problems seem to arise, and not every person
with wireless has them, but many do. Broadband noise and "spikes" from Part
15 devices. The worst offenders are telephones, but similar problems have

been reported with with wireless internet.

I had it here...and believe me, it was not the "minor" problem noted by your buddy. I no longer have wireless internet.

You might be one of the lucky ones, I sure hope so. The principle remains the same, we are subject to interference from these non-licensed devices with little recourse, so being a licensed service doesn't really provide the protection the rules supposedly provide.

I've heard of no case where the offending signal from a ham caused the ham to have to do anything. The real problem is the interference generated by the Part 15 devices to ham receivers. Good luck, and hope to see you on AO-40.

The cited link is no longer available, but this is what I know:
They are out of business. They had lots of various problems.
They were even shut down at one location in Dallas/Ft Worth due to
interfering with a licensed service, (Amateur)  as I understand.

69. [aprssig] javAPRS Findu Update

From: "AE5PL Lists" <HamLists@ametx.com>
Date: Fri, 5 Apr 2002 09:32:35 -0600
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-72441-2002.04.05-10.06.00--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I have updated certain http://findu.ae5pl.net pages to take a latitude
and longitude instead of a station ID/callsign. There are now two GUI
interfaces: one based on a station ID/callsign being entered and one
based on a grid square or latitude/longitude pair being entered. If you
have links that go directly to one of the .asp pages, those links still
work correctly.

javAPRS Findu is now using javAPRS 2.2 build 17 which has a
map-follows-station function and a dead reckoning function for single
stations.

73. [aprssig] BEACONet^31 on 20-meters [was:European APRS on 14.105.5]

From: "Ev Tupis (W2EV)" <w2ev@arrl.net>
Date: Fri, 05 Apr 2002 16:07:01 -0500
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-72470-2002.04.05-15.49.47--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

We're starting to play a little on 20-meters.

BEACONet^31 uses PSK31 (instead of Ax.25) and UI-View configured to transmit position reports using the format:

```
FOR INFO: HTTP://GO.TO/BEACONET
CALLSIGN>CONFCODE-##:[GR##ID]^CRC
```

The first line is simply a preamble to allow time for the PSK31 system to lock-on to the signal. The second line includes 4-components:
o Callisgn
o Configuration Code (optionally, simply use CQ)
o 6-character grid-square between square brackets
o a CRC value that assures the transmission is received correctly

Get the software and setup instructions at the website noted above.

We're playing on 14.094 MHz USB + 1500 hz PSK31 audio.

Just FYI.

Ev, W2EV

btw...all is alive and well on 28.131 MHz USB, too. we're just poking
around on 20-meters for fun right now.

74. [aprssig] PCsat Status

From: Bob Bruninga <bruninga@usna.edu>
Date: Fri, 5 Apr 2002 19:55:26 -0500 (EST)
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Cc: Robert Bruninga <bruninga@usna.edu>
Message-ID: <LYR842-72503-2002.04.05-19.29.00--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

We are seeing some PCsat improvement.

At about 0030z on the 6th, I saw a T#56 showing battery voltages of 15.9 and 16.5 volts. This is about 5 minutes into eclipse and represents about 1.32/1.35 volts per cell.

Checking the APRS internet feed backwards to 2314z I found a telemetry count of T#80 captured by the ZR1CBC sategate in South Africa which represents 80 minutes out of our 100 minute orbit and PCsat was still running (but going to die any moment at 1.05 and 1.15 volts per cell).

This was 25 minutes through our 36 minute eclipse and the longest we have seen so far. Notice that we are still in maximum eclipse but on the way out, but the real improvement is that more of our +Z face is illuminated as the orbit precesses more into the northern sunshine and the sun moves northward.

In another week we may be out of the woods! (for a month..)

75. [aprssig] Weekend Lawyer bait...

From: Bob Bruninga <bruninga@usna.edu>
Date: Fri, 5 Apr 2002 23:33:25 -0500 (EST)
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Cc: TAPR APRS SIG <aprssig@lists.tapr.org>
Message-ID: <LYR842-72517-2002.04.05-23.07.05--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Here's an "illegal" one for the shack-lawyers:

My 13 yr old licensed daughter is going on a backpacking trip and will be carrying an FRS (for comms amongst the scouts). She does not want to lug along a HAM radio too. (Every ounce hurts after a 3 day weekend of carrying everything)... I'd like to keep in touch, but I am 40 miles away.

What if we put an FRS in a box with her 2m rig and left it in the car in the parking lot (on a central hill) and put them both on VOX and PL.

The scouts would operate on FRS channel X with no PL. Only my daughter knows the PL of the FRS in the box. Now, I can transmit from home on VHF with the correct PL for the VHF radio to hear me and the FRS will key up and she will hear me just like anyone else in her group. But no one will key up the return link but her, because she only selects the correct PL when she wants to talk to me.

Legal? No for lots of nit-picking reasons... and we will let all the lawyers list them... But then conversly, everything is done more or less within the spirit of the rules:

1) FRS is operated entirely within the spirit of FRS. No mods to the radio, no mods to antennas, power, or controls. No non-type approved interfaces to any FRS radio. No attempts to extend the RF range of FRS in any way. My daughter and I are using it for family communications over short range.

2) Similarly, We are both licenesed HAMS. We are communicating on 2m via HAM radio. I am the control operator of my station, and my daughter is the control operator of her's (left in the car.)

3) You could go one step further if you wanted, and say that she is operating her 2m rig in the car as an auxilliary station under remote control on a frequency above 225 MHz... ;-)

4) She has taken extra ordinary steps to prevent unlicensed access to her station. That is she has a control scheme that reduces the chances of someone controlling her station to less than 0.0018... pretty darn small way out in the woods..

Don't worry, I'm not going to do this... but it was an interesting idea... If you ever do expect to provide emergency communications, sometimes it is worthwhile to think out side of the box in advance so that if you need to rig up something under stress, you have already thought it out beforehand...

Having lobbed that one over the fence...
Ducking for cover...

Bob, WB4APR

They're like telephone poles except they have power lines instead
telephone lines.  They're great for end supports for dipoles.

What's odd is that Andy has been engaging in this sort of activity (that
I'm aware of) for at least 15 years, and not one person that he's wronged
has ever taken the law into their own hands...

My advice to anyone in a similar situation: Contact a lawyer.   It's
amazing how sometimes when law enforcement/prosecuters won't listen or
respond to an individual who has a problem like this that a letter from an
attorney will change their minds, especially if he reminds them that their
job is to "protect and serve."

From my personal experience, the police and courts are loathe to engage in
cases like this, but will intervene in STUPID minor issues in matters if a
business complains.   Don't return a rental video tape to the local
convenience store on time and you're likely to have State Troopers knocking
at your door...   Swear at a stupid Taco Bell employee (for allowing gang
members to terrorize patrons) and the next day have two San Diego cops at
your front door...   Not that I'm speaking from experience or anything. ;)

I think that this bit here is your saving grace. I don't recall there being any rules defining how you control your station provided that if its by radio its above 220MHz. One would have to take precautions so that non-hams could not use it but even then you might get away with 3rd party traffic rules.

As they say in the Unix world "/JFDI" !!!!!

Two thoughts...

* make the rest of the troop hams and then have them only carry ham radios and dump the FRS (I used to carry both FRS and ham radios while biking. I got tired of lugging both and made my normal riding partners take the test.)

```
    ...and, since this is titled lawyer bait...

    * modify a ham radio to TX/RX on FRS frequencies and
      have her carry that to cover both services (except
      for a bit of clipped audio on the output side when
      using FRS, the D7A makes this really easy)

    Matt (k4mls)

Forget the radios all together!  Let her enjoy the peace and serenity of the
journey...away from her parents!
Remember when you were 13 years old? Why, I had a blast chasing those girls
all over the mountains!
On second thought.....do you have any chains and maybe a chastity belt???

I believe the correct term is "armchair lawyer".

I'd go to the FCC for my regulatory questions, not the APRSSIG. The other thing I tell people if they are thinking of doing something questionable, is to not publicly announce it on a mailing list beforehand and admit what they are about to do is illegal. Makes it tough to feign ignorance when the FCC cite's you. (I imagine a few of their lawyers know how to use search engines). Unless of course you were the kid in elementary school who used to put a sign on his own back that said "kick me". The term "don't ask, don't tell" applies to more then just gays in the military.

Also, if you are a ARRL member, they have a forum for asking these kind of regulatory questions, and at least you can keep it low profile if you don't like the answer you get.

-Jeff

Russ, KB0TVJ, asked me to pass along this news.

73,

Stan, WA1LOU

------ Forwarded Message
From: "Russ Chadwick" <kb0tvj@peakpeak.com>
Date: Sat, 6 Apr 2002 04:37:58 +0100
To: <wxsig@lists.tapr.org>
Cc: <russ@wxqa.com>, <stanzepa@earthlink.net>
Subject: NOAA Environmental Hero Award to APRS person

Each year NOAA (National Oceanic and Atmospheric Administration) gives a number of Environmental Hero Awards to people who don't work for NOAA, but have contributed a great deal to NOAA's ongoing job of providing environmental services to the citizens of the United States. This year NOAA's Oceanic and Atmospheric Research Office gave five of these awards and one of them went to an amateur radio operator deeply involved in APRS.

On April 6, the office of David Evans, the Associate Administrator of NOAA in charge of research sent out an e-mail with this statement,
.....

I am pleased to announce the NOAA Research winners of NOAA's Environmental Hero Award. This award is for "real people" outside of NOAA who have volunteered their time or who have worked closely with NOAA through their respective organizations. Please join me in extending congratulations to the winners.

Name: Dr. Steve Dimse
Organization/Location: Cudjoe Key, FL
Accomplishment: real-time citizen weather observations
NOAA Nominating Division: NOAA Research
.....

After that there were four other names or organizations with these accomplishments:

Environmental awareness/safe and pollution free Hawaii

Development of GFDL hurricane forecast system

Assisted with CMDL Cooperative Global Air Sampling Network

Conservation of Great Lakes Fisheries

Each of these winners will receive a signed letter of appreciation from the NOAA Administrator.

Steve Dimse has been instrumental in developing the network of citizen and ham radio weather observers who send in their data to findu.com. Presently there are about 570 registered stations and about 350 to 390 are contributing data at any one time.

The contributed data are used for numerical weather prediction research at NOAA's Forecast Systems Laboratory (FSL) and for training and research at the National Center for Atmospheric Research (NCAR), both in Boulder, CO. The data are sent to the National Center for Environmental Prediction (NCEP) in Camp Springs, MD. In Florida, the data are used by NWS Weather Forecast Offices for local area weather prediction. They are also used at Kennedy Space Center (KSC) for weather prediction in support of launch operations. The data are also used by the Long Island Railroad for weather monitoring along their routes. This summer the data will be used for a major temperature and air quality study in the New England area.

Congratulations to Steve for his award and thanks to all of you who go to

the trouble and expense of setting up a weather station and sending your
data to findu.com. All of your weather data are being put to good use.
What better way to do the type of citizen public service that President Bush
recently called for.

Russ Chadwick   KBØTVJ
Boulder, Colorado

Just do it! It is experimental - like the whole ham radio live - or not?
You only can get and hold newcomers with 'interesting live experiments'...

```
The icons in WinAPRS that are less than 32 (ascii SPACE) are used in
maps and other things and are not part of the standard APRS icon set.
If you look at the specs, there is no COUNTY SEAT icon defined..

We added this and many other icons for local purposes only..  You can
create them in maps..

># 09 icon;

This would be VERY illegal and here is why.
Somehow some OTHER FRS user stumbles onto the right tone and starts sending
who knows what. You have no way to control this.

```
The Gateway Solo 9300 Laptop I previously advertised is still for sale
price reduced to $1500.00 with shipping included CONUS.   $1400 CASH if you
pick it up in Sioux Falls...

Highlights:

750 MHz PIII
192 MB RAM
ATI Rage Mobility Video Chipset
20 GB Hard Drive
8X DVD
120 MB SuperDisk drive (internal)
Firewire Port
SPDIF out (RCA)
Win2k and Office 2000 (Original Disks included)
Pony-pack Battery
MD-3 Full Docking Station (with PCI slot)
Video In and out (composite and S-video)
Custom Targus leather-like carrying case
XTend 12 volt auto/airline adapter
Linksys 10/100 PCMCI Ethernet NIC

---------------------------------------------------------------------------
I also have a Gateway Solo 1100CS Laptop for sale.  Price is $390 with
shipping CONUS.  It has one minor flaw - the left click button on the touch
pad is broken, but otherwise in very good condition.  Left clicks can
always be accomplished by tapping the touch pad, though.   I always use a
USB optical mouse anyway...

Windows ME and Office 2000 are installed, but no OS or other disks are
included in price.

433 MHz Celeron processor
32 MB RAM
CD ROM and Floppy Disk are both internal in this model and can be used
simultaneously.
NeoMagic 128 video chipset
4.5 GB hard drive (formatted capacity)
built-in 56K modem
one USB port
12.1" DSTN Display
Custom padded-nylon Olympia Case included in price

Please contact me off-list for payment instructions on either laptop.
----------------------------------------------------------------------------

I have an AEA DM-1 Deviation Meter for sale:
$65 with shipping CONUS.

-----------------------------------------------------------------------------

Kantronics "KPC-9612 PLUS" TNC with version 8.0 firmware.
$170 with shipping CONUS.
Make me an offer on this one - trades even...
-----------------------------------------------------------------------------

And finally I have an IRDA module for any desktop PC that has an IRDA
header on the motherboard (most PII and up do).
$14.00 with shipping CONUS.

Perfect for hotsyncing your Palm or WinCE device to your desktop without a
cradle or for sending pictures from your IRDA enabled Digital Camera.  Also
```

works with several Cellphones (Nokia, Ericsson, Motorola Timeports, and Samsung SGH's). The only reason I'm selling it is because I replaced it with a USB variant to free up my Com2 port...

Price includes the FIR cable and IRDA module, no case or mount is included.
See: http://www.jdresearch.com/irdrive/irmodule.htm
http://www.jdresearch.com/irdrive/FIRC.html

One of the key elements of this satellite is the STS safety challenge. While I was at JSC, we had several conversations with SEDS/SEDSAT about how one could safe, pass safety for, and launch a satellite from the Shuttle system with such a modest budget. I'm sure it could have been done before now, for the same general price range. It took a champion, and a dedicated team.

What surprised me was the idea that the flight software was written in BASIC!

Actually, I don't think it's illegal at all from the HAM radio point of view.
I mean, it's legal for people to use 49MHz as a wireless mic and control, right? And I've seen construction articles on this, where people use wireless phones as 'controllers' for their radios (in one case a Kenwood HF rig).

The fact that someone 'could' step in does NOT make it illegal. The fact that someone DID step in makes you RESPONSIBLE after it happens. Quite a big difference from being illegal. (Sorry, but trying to
turn something where you're responsible after the fact for something that went wrong to something where you're illegal before you start because something MIGHT go wrong is an argument that (in my mind) belongs in the gun control crowd, or with the people who want to make it illegal to by HAM gear without a license.)

But... I do believe FRS has restrictions on tone usage through the FRS service.

Mike

(e) No station shall retransmit programs or signals emanating from any type of radio station other than an amateur station, except propagation and weather forecast information intended for use by the general public and originated from United States Government stations and communications, including incidental music, originating on United States Government frequencies between a space shuttle and its associated Earth stations. Prior approval for shuttle retransmissions must be obtained from the National Aeronautics and Space Administration. Such retransmissions must be for the exclusive use of amateur operators. Propagation, weather forecasts, and shuttle retransmissions may not be conducted on a regular basis, but only occasionally, as an incident of normal amateur radio communications.

not sure however what is a "radio station"

but i recall one time seeing that amateur service can not re-transmit
audio/data from any other service... also.. can anyone explain what a
"radio station" is?

Not sure, if you're serious or not.

A radio station is an appartus that sends RF thru the
either. It basicly has a transmitter and an antenna.

You have an amateur station license KB0RPJ.

Along with that you have a operator's license that
allows to operate stations in the amateur service in
compliance with the privledges granted to that
operator's license.

The station license can be used on any ham frequency
provided there is a control operator with
the proper class operator license at the control point.

As a matter of fact, you can.

My console connector is red and black, in OCRACES config, plus blue (output
to lights) and orange (ignition switched power)

They are stacked into a single 2x2 connector, and mate into one half of a
four-pair socket from powerwerx.  The other side is two more OCRACES outlets.

The Garmin 35 is about as simple as it gets...no display..unit looks like a computer mouse which contains the entire gps including the antenna.

I've used the RandMcNally (sometimes available on the RMC website for $70 --
I bought mine packaged with the RMC StreetFinder CD-ROMs for $100), the
Delorme Earthmate with the Byonics GST-1 translator ($129 +49 for the
converter), the Holux GM-200 ($150) and the Pharos ultra-compact iGPS-180
($180) all successfully.

All these units are "mouse"-type devices that are a combined antenna and
receiver with no display and a cable that forks into a DB-9 for data and a
PS/2 plug that goes into a PC keyboard jack to pick up 5 VDC power.

If you can find them, TripMates are out there for about $50. Or maybe
less, as $50 is what DeLorme was charging for 'reconditioned' ones.

Consider a used unit as opposed to something new. Depends on what
you want, really. I have a GPS-12 I'm probably going to sell soon, but
I don't have any idea what it's worth. Hopefully I won't get hosed too
bad!.

The full (standalone as in bought separately) version of Quick Basic includes
a complier that is not part of the "lite" version of QB included as a
freebie with DOS.

The full QB 4.5 environment looks exactly like (and lets you edit/run/debug
interactively) like the regular lite version. In addition, the "RUN" pulldown
from the menu bar includes "Make Exe File ... "

In turn the generated EXE can either depend on a QB runtime library,  or be
completely standalone with the runtime embedded at the cost of about an extra
70K in file size.

Rob,
  The best thing that I've found for the money is the Garmin e-Trex. From AES for $119.99 It syncs in seconds vs. the Delorme Tripmate at 10+ minutes.

Just make sure you get the 010-10268-00 PC cable with Cig adapter. $50 That way you don't have to keep feeding it batteries. (Not available from AES.)

The garmin GPS 35 is nice although I'm not sure which model you would need.

The price of either solution is about the same but you can do more with the hand held.

I sure would like to hear what everyone else is running.

Good news Central Pennsylvania Repeater Association digi (WA3KXG-2) went
on the air yesterday, 7 April 2002. Located on Reeser's Summit along
I-83 south of Harrisburg. This digi should fill in the gap in coverage
in along I-81, and in the Harrisburg and surrounding areas.

John

I bought this cable for $35 at TVNav:

http://www.tvnav.com/miscgpsitems.html

Their website is not one of the slickest, but some of their prices are.
Etrex is $115 there I think. Perhaps there are even cheaper suppliers;
I'd love to hear about that.

Thanks and 73s,
--Alex

124. [aprssig] PCsat Recovered!

From: Bob Bruninga <bruninga@usna.edu>
Date: Mon, 8 Apr 2002 09:26:50 -0400 (EDT)
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-72902-2002.04.08-09.00.35--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Over the weekend of 6 April, PCsat has finally made it back into a
positive power budget and has achieved a full charge on the batteries
allowing it to remember its commands for more than the one hour sunshine
of each orbit.

We thank the dedicated efforts of these command stations around the
world: G6LVB,IT9GSV,LU7ABF,LW2DTZ,VK3JT,WB4APR,ZL1AOX,ZR1FN,ZR1CBC who
have attempted commands on over 400 orbits since this problem began on 10
March.

We have enabled the DIGIpeater again for limited operations probably
through 10 May. Then we may have to go back to low-power ops until we
reach full Sun in the first week of June. This may be modified over the
next few days as we learn more, but remember, PCsat's batteries have
been severly weakened. This means:

1) Operations during DAYLIGHT only.
2) No operations after dark
3) Cease operations whenever you see packets with 11111111 telemetry.
4) Be conservative and minimize the number of packets you digipeat
5) No routine automatic unattended operations
6) Keyboarders welcome.

The thing to watch is the battery voltages before sunrise.

```
   W3ADO-1>BEACON,SGATE:T#172,162,162,081,212,213,00111111,0111,1

   The ending ,xx11,1 means this is the TLM with battery volts in it.
   The T#172 is minutes since last RESET (or turnover at 999)
   The first two values, 162,162 are the battery voltages (16.2)
```

When PCsat battery volts get below 14 volts, we worry. Sunrise is now
occuring over the extreme southern hemisphere so we can only see this data
when IGates in Australia, South Africa and Antarctica send packets to
findu.com in the very early hours before sunrise LOCAL time.

Steve Dimse, K4HG has added a switch to let you see the PCSAT feed with
absolute time instead of packet AGE... Just add "absolute=1" onto the end
of your cgi request..

http://www.findu.com/cgi-bin/pcsat.cgi?absolute=1

This makes it much easier to correlate what is happening to PCsat and
when. Thanks Steve!

de WB4APR, Bob

Rendered body type: text/plain

I had a problem getting PmapOCX.bat to run on my new WinXP laptop. Got an error every time I ran it from Windows Explorer or from <Start><Run> which always worked with Win98. In XP under Windows/System32 there is a program called "cmd.exe" which performs "Text-based (command line) functions". Ran PmapOCX.bat using "cmd.exe" and it installed perfectly. Anyway, this is for the "what its worth department."

126. [aprssig] Question about using an HTX202 as a tracker

From: Paul Jacques <paulrjacques@yahoo.com>
Date: Mon, 8 Apr 2002 07:07:31 -0700 (PDT)
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-72928-2002.04.08-09.41.06--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Hi,
I'm building a tracker using an HTX202,a TinyTrak II
and a Pharos GPS. I want to leave the HTX power switch
on, keep it inside an enclosure and have a case
mounted power switch to turn power on to the THX, GPS
and TNC.
My question is, if I remove the battery from the HTX
and only power it through it's top connector, with no
power applied will the HTX eventually lose it's stored
settings?

Thanks,
Paul

Rendered body type: text/plain

```
My understanding is that the external top jack on the HTX-202 and 404
HTs is direct, but the bottom battery connector is through a diode.
Othewise they are the same.  I know there were a few early units of the
202 that had an issue with the diode, but not the later ones.

If you mean does the 202 'bypass' the internal lithium when there is
external
power applied (regardless of the switch setting) so as to increase the
life
of the lithium cell, probably...

Mike

128. [aprssig] Time change !? (dayling savings time)

From: "Richard Amirault" <ramirault@erols.com>
Date: Mon, 8 Apr 2002 12:58:53 -0400
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-72951-2002.04.08-12.33.09--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

```
Bob hasn't mentioned it ... so I'll say .. for all those APRSdos users out
there (all three of you ;-) remember to change the time on your PC (if it
isn't running Windoz), but also change the ZONE within APRS (Ctrl-S, Other,
Zone)

I have no idea what (if anything) windoz versions need to do.

I am seeing a local WX station packets *every* hour  (10 to 18 per/hr) but
because (I'm assuming) if it's time stamp it is *not* showing up on my
screen.  (shows up fine in findu)  I have no idea what version APRS he is
running.

Just because you can see yourself on findu does not mean you are showing up
on local (RF) screens. Then again, the problem could all be on *my* end
too!
```

```

Most recent versions have a better way.
1) Change your clock to the new local time.
2) Next select alt-S-OTHER-DAYLIGHTSAVINGSTIME...

This will keep you from having to compute the UTC offset each time...
Bob

130. [aprssig] D700 lockups chapter ???

From: Guy.Story@levi.flyingpig.net, KC5GOI <kc5goi@kc5goi.net>
Date: Mon, 8 Apr 2002 12:21:25 -0500
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-72954-2002.04.08-13.03.07--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I know this has been talked about but never saw a permanent solution. My D700 has gotten to the point that if I run WinAPRS, APRS+ or pocketAPRS (have not tried UI-View or Xastir but feel it is irrelivant) when I exit the program and try to go back to APRS mode, the tnc hangs in opening tnc. I have tried the trick with the PMs and found that if I hit the pm button after turning on the radio, it still tried to open the tnc first. I have to do a VFO reset. That flushes various settings that have to be dealt with. Has anyone come up with a solution? I emailed Kenwood's support last week and have not seen a response yet. If we do not have a solution, I will be talking to hte Kenwood rep at Dayton about this issue.

132. [aprssig] Storm Plots & findu

From: dale huguley <kg5qd@earthlink.net>
Date: Mon, 08 Apr 2002 13:59:07 -0400
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-72957-2002.04.08-13.33.08--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Hi All-
Looks like the Spring storm season has arrived- if a bit late this year.
  As you may or not be aware, plots of storms from Wxsvr are valid
objects for findu.com. If you see an object with a name such as
LIXT1735z - this could be plotted at street level at:
http://www.findu.com/cgi-bin/find.cgi?LIXT1735z
since Steve's cgi allows wildcards-
http://www.findu.com/cgi-bin/find.cgi?LIXT*
should plot tornadoes in the LIX (New Orleans) area
http://www.findu.com/cgi-bin/find.cgi?LIX*
should plot tornados and Severe Thunderstorms

http://www.findu.com/cgi-bin/radar-find.cgi?call=LIXT1735z&zoom=2
shows the tornado over the radar plot for that area
Make sure you compare the timestamps of the storm and the radar- they
may or may not be in sync.

Good evening everyone. I have updated the web page for the findu.com backup
status. Sorry for the delay. Only the estimated amounts have increased at
this time. I have handed the DCARC the checks after I made a list of who has
mad donations. I will post a credits page in the next few days. I know I
promised to have that up last week but life has gotten busy at home. Those
of you who have requested the letters for the tax deduction, I will check on
the status of those.

The HTX-202 uses an internal, buttun cell battery to keep it's memory.

What you have planned should work just fine

Rendered body type: text/plain

```
A few new things for findU. First, the documentation is finally done, all the
parameters for all the public cgis are documented. There is a new parameter for
PCSat and ARISS showing absolute rather than relative times. Finally there is a
new cgi which allows you to place MapBlast images on your own web page.

All of this is documented with links and examples on the "What's new" page of
findU...check it often!

http://www.findu.com/new.html
```

Bad news and good news.

My brand new Suburban was stolen last night.

The good news is that I got one position report off the tracker.

```
WB0WNX-3>TR2Q5V,WB0WNX-6,WB0WNX-4,K0BOY-1*:'|4Pl j/]
```

Can someone help me translate this into Lat/Long and tell me if it is:

Degree Minutes Seconds
or
Degrees Minutes Tenths.

Also, what datum would it be?

Can't fill you in on the details yet, but it is important if this position is someone's driveway or not.

Dave
WB0WNX-3 Stolen Suburban

142. [aprssig] Recent product with APRS uses (Keyspan USB remote)

From: Mark Fellhauer <sparkfel@qwest.net>
Date: Mon, 08 Apr 2002 21:48:34 -0500
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-73000-2002.04.08-22.22.37--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

I recently discovered a product that will work with both Mac And Windows PC's that may have some applications for APRS'ers.

It's the Keyspan USB Digital Media Infrared Remote.

http://www.keyspan.com/products/usb/remote/

I purchased one for $25 from an eBay E-tailer which is significantly cheaper than other online sources. Installation was flawless - load the software, plug in the remote receiver, and go. The remote receiver has a USB "B" port on the back, so you can use the included 3 foot cable, or use your own longer one. The remote receiver has a built in tally light that provides positive feedback to any strong IR source (including cameras and IRDA ports) and also flashes in various manners to let you know if the remote software/driver is loaded and running correctly. A nice touch is the slot in the remote receiver that provides a place to park the included slim 17-button remote, which looks like it would be easy to lose. The remote receiver seems pretty immune to false signals, and mine sits about 6 feet from a fluorescent floor lamp.

The remote itself is powerful, and I found that it easily covered 25 feet between it and the receiver. I ran out of room before I ran out of remote. :) It also "bankshots" nicely. The remote is powered by two standard CR2025 lithium batteries. It also appears to be of higher quality than other slim remotes I've encountered, like the X-10 RF credit card/slimfire or the remote included with many Creative Labs products. No flimsy plastic or cheesy membrane buttons here. I just wish it had more buttons. According to the included documentation, the remote receiver/software will also work with a JVC VCR remote, in case you lose the included remote or have a learning/programmable remote. For those of us lucky enough to have a high-end remote, like a Pronto or an IRIQ Madrigal, it'll be a snap to program custom pages and macros for this product.

The included remote software is both polished and powerful, and includes button mapping for many common Windows applications including WinAmp, Powerpoint, and Cyberlink's PowerDVD. I was quickly able to customize the software for WinAPRS, so that I could zoom in and out on maps, scroll left, right, up, and down; and access the menu functions via alt-F. I mapped the select key on the remote to mimic the enter button on the keyboard. And it appears I haven't even begun to explore the possibilities the software offers. It is possible to cycle through many running applications and control them all with this remote. Keyspan's website has all the software and documentation online, so you can look before you buy.

I'm imagining other ways to integrate this product into the hamshack, and I think it would be perfect for use with receivers and transceivers that are computer controlled. I have a BC895XLT scanner that I've always wished had remote control, so that I could pause scanning when an interesting transmission came on, without having to get up from the couch to start and stop scanning. It looks like the Keyspan USB remote should be just the ticket for fulfilling my wish.

I know that some of you are thinking, "why would anyone want a remote control for their computer, especially when you're usually sitting 12 inches from the darn thing most of the time..." Well, I'm porting video via an S-video link from my computer to my home theater setup. This way I can sit on my couch, switch my TV monitor over to display WinAPRS, and scroll and zoom around to see what interests me on the screen. All this is done with one remote, an IRIQ Madrigal. Yes, I want to be the ultimate couch potato.

I own or have owned many products that have promised IR or RF remote control of a computer and found most to be lacking in one way or another. Most have inadequate software that only allows you to use the product with a few popular software titles (and then only certain versions). That or they require you to give up a valuable serial port. The Keyspan Digital Media Remote looks to be a near-perfect solution with its USB connectivity and flexible software. Yes, I have a wireless keyboard/pointing device, a Silitek IR SK-7100; a specially made version in putty which doesn't hog a serial port. But it's hardly pocket-portable and can be cumbersome to hold and keep it pointing at the IR receiver at the same time. I suppose an RF wireless keyboard would be a solution to the pointing problem, but then it's just adding another possible avenue of RF problems in the hamshack.

Anyhow, I hope some of you found this review useful. And I'm not affiliated with Keyspan in any way - just a happy couch potato.

73,

Mark

While we dictate that the official datum for APRS use is WGS-84, there's
no place to specify a different one.

Nope, Motorola had selectable datums, and the NMEA output reflected the
selectable datum. Trimble, who decided they defined the market, always
put WGS-84 data out, regardless of what was on the front panel, which
was, in its own cute way, internally consistent.

The Interface Control Document does not address this issue.

> If the APRS programs look for the proprietary Garmin string that
> states the datum and do a datum translation on the incoming NMEA
> positions, things'd be fine. I doubt many of the programs do that.

Garmin's proprietary string does this... I'd forgotten. But, I tend to
not have a Garmin handy, so even if we change the spec, I'll still just
have to plod along, and tell my receivers to send in standard WGS84
datum... the datum that was created for use with GPS!

> Repeat coding times the number of different proprietary strings and
> formats that might come from other GPS manufacturers. I don't think
> the datum is listed in any of the generic strings ($GP*).

Not to the best of my knowledge.

Looks like it was heading south from Dave's QTH.  My bet is that it was on
its way to Lincoln, NE to be parted out for crack money.   The aerial photo
from the Terra Server is interesting, though.   I hope they didn't just
ditch it in the river.

Sorry, Dave...

Wow, that's a BIG question, and there are many ways to attack that problem. None of them are easy or cheap, though. At least none that I know of.   Hey, but if you buy the Solo 9300 I'm selling it has all the hardware and software built-in to do it.   Really, we use(d) this laptop to make Powerpoint demos with video for court presentations.

I'm not aware of any software that will directly dump a moving screen capture to streaming video without any intermediary hardware, but then again, I've never looked.   I could use something like that, though.

My advice would be to dump the display to an SVGA-to-NTSC converter and then to a VCR (preferably S-video for the converter and and S-VHS for the VCR).   And then I would use something like a Dazzle (www.dazzle.com) or video capture card to turn the video into an MPG or AVI.   You could probably get by doing the whole thing with an ATI Radeon ALL-in-Wonder card and a VCR.   The retail version of the Radeon All-in-Wonder card comes with Ulead Video Studio 5.0, which is fine for making and editing small video clips. Remember, you'll need a pretty high-end computer for good results, though. I would say at least a 600 MHz PIII with 128 MB of RAM.

If it were me, I'd dump the SVGA display to an SVHS deck with my ATI video card's S-Video port, and then drive over to my office. I would then feed the video into our Avid Meridian with one of our JVC or Panasonic SVHS commercial edit decks. Then I would use Avid Xpress to edit the video and lay in a music score and convert it to an AVI or MPG. Then I would dump the video clips over to a work station with a CD burner via Ethernet and burn the clips to a CD...

But, then again, I work in a commercial video production lab... ;)

Windows Media Encoder:
http://www.microsoft.com/windows/windowsmedia/wm7/encoder.asp

WME claims to support full narration and such for producing "training
videos" and tutorials. Look for "screen capture" tools and codecs.
They used to have a specialized program for capturing screen movements.
But, I can't recall the name. I used it once years ago. It would
generate an AVI and optionally a standalone executable. Maybe part of
Office or PowerPoint or something.

Caveat: I've never used WME and have no clue how/if it works.

The Magellan 310 is a fairly simple one as far as handheld units go, and
compusa has them on for $50 including a coupon for a cable. It looks like
they are sold out on line, but if you check here:
http://www.compusa.com/products/product_info.asp?product_code=280847
you can search for bricks and mortar availability.. I've never used one, I
just ran across this deal.

best regards,
scott anderson, VE7OLF

```

```
I think the question was a little more subtle than that,  With a lot of
pieces
of equipment, if you have an external power source attached, it MAY,
even with the switch off, bias the interface to any internal lithium cell
so
that the 'backup' power now comes from the power source, not the
lithium cell.

This really isn't THAT much of an issue on the HTX-202, but on some
pieces of equipment that drain the lithium cells fairly fast, it can be
important.

The problem is probably one of perception.  The HTX-202 (and 404s)
had a reputation for burning out the lithium cells for a while.  This was
actually unfounded.  What happened was the replacement cells from
RS evidently got a reputation for not lasting very long.  I can only
guess,
of course, but I suspect that the replacement cells were part of the
original 'replacement parts' in inventory provided by Maxon at the end of
the production run for the HT, and as a result were as old in stock as
the units themselves.

I know I personally bought a replacement from RS that lasted less than
year in my HT, so when it went again, and my other HT went, I wired in
'generic' coin batteries.  And they are still in there.  Once over 4 years
now.

Mike

I've been running an HTX-202 for at least 2-3 years as a tracker connected
to a TinyTrak II. It was originally connected up to a TinyTrack, but I
upgraded
earlier this year to the newer firmware tracker. I've not boxed it up as it
sits
on the floor of my van under the seat strapped to a piece of masonite.

In all that time, only once did the permanent memory in the HTX-202 get
scrambled. At first, I thought the internal battery had died, but after
resetting
the RAM, the unit has been fully operational since.

Rendered body type: text/plain

That's pretty cool! It should be noted though that the list includes the same call multiple times if the callsign has been used with different SSIDs, so the 1118 separate calls does not mean necessarily mean 1118 different hams.

hmmm....how about a RAS (Relayed All SSIDs) Award?

73s,

>is there a list of geo files that are on the server? eg usa.geo

No list, because there are just a few, the idea is you make your own geos and leave them on your own server.

usa.geo
keys.geo
camano.geo (north of Seattle, see track.microship.com)
carib.geo (carribean)

there is one for each of the NWS radars, of the form rad_xxx.geo, where xxx is the three letter radar callsign.

>and how hard would it be to make a php/perl script to so you can enter an
>address and have it extract the lat/lon out of the url and post it to find
>u?
>would be an internally ran script from my server here at the house...

Sending your position to findu is easy with the inputpos cgi, you'd need to come up with a source for the geocoding. You could use MapBlast or another service, and parse out the lat/lon in the returned page. I've played a bit with this, the URL is pretty straightforward, this seems to be the smallest you can get away with, putting the address into AD2, AD3, and AD4:

http://www.mapblast.com/myblast/map.mb?CMD=GEO&AD2=4624+sw+64+ct&req_action=
crmap&AD4=USA&AD3=miami%2C+fl

This is far from perfect, putting in my Keys address:

http://www.mapblast.com/myblast/map.mb?CMD=GEO&AD2=189+Le+Grand+Lane&req_action=
crmap&AD4=USA&AD3=Cudjoe+Key%2C+fl

returns a position on Little Torch Key, 4 Keys and 6 miles from where I live. It is true that MapBlast, like most mapping sites, have a typo in the street name, calling it Le Gland Lane. However, entering that gives no match:

http://www.mapblast.com/myblast/map.mb?CMD=GEO&AD2=189+Le+Gland+Lane&req_action=
crmap&AD4=USA&AD3=Cudjoe+Key%2C+fl

Many times when I use this I get no match on good addresses, and therein lies the rub...

Parsing the lat/lon from the returned page is pretty easy. However, writing a

script that handles all the possible errors and ambiguities that occur is a more
difficult task, and the reason that I have not produced something like this. My
thought was to do it for the various near scripts, I'm not sure how useful the
position entry would be. If you come up with something robust let me know...

What is the point of changing your SSID multiple times? I understand that
one can be home, one can be the car, one can be a digi. Any more than that
is taking time and resources from others that want to use the bird. If
someone is just sitting home and changing the id # just to say they are
making more contacts, its a waste of time and making it inoperable for
others.

Nomex is on.

163. [aprssig] APRS IS Status

From: "Roger Bille" <roger.bille@telia.com>
Date: Tue, 9 Apr 2002 23:57:23 +0200
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-73111-2002.04.09-17.31.04--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Dear all,

I have created a status page over the APRS IS (Internet System) servers that are currently up running. The information is mainly gathered through the normal aprs feed. Some extra information is taken from the servers status port. I have been doing this for some time but feel now ready to announce it. The page will show servers that have been heard the last 2 hours. Be aware that all information is not available for all type's of servers, for example UP time and number of users.

You can find the status page here: www.ahubswe.net/aprs_stat.asp

As you can see some fields provide some extra information that is not part of the normal feed.:
   Clicking on the server name go to the operators homepage
   Location for some server systems
   URL
   Port
   Email to the sysop
   Any comment

For the server operators: If you want to have any information added here about your server please send me a mail.

The main purpose of the page is to provide status for APRS IS servers and not IGATE's. But since many IGATE's are using aprsd that is also used by a number of APRS IS servers they are displayed. If any server that is listed on this page is only acting as an IGATE please let me know and I will take it off.
I will probably remove all servers for which I don't get a working URL/Port in the future. The same is valid if there are any servers that are missing, let me know.

Please send me any comments, suggestions, corrections etc about this page.

Having reported 1118 PCsat users, Steve, K4HG went back and queried his
worldwide APRS database (findu.com) and similarly came up with 1504 ISS
packet users.

I put a text file of all those callsigns on my ISS-FAQ page below.

ISS-APRS FAQ: http://www.ew.usna.edu/~bruninga/iss-faq.html

165. [aprssig] 2002 Digital BASH at Dayton Hamvention

From: "John R. Ackermann" <jra@febo.com>
Date: Tue, 09 Apr 2002 18:17:11 -0400
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>

Message-ID: <LYR842-73116-2002.04.09-17.51.13--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Going to the Dayton Hamvention? Then plan to attend the annual Digital*BASH sponsored by TAPR and the Miami Valley FM Association to be held on Friday, May 17, 2002!

For reservations, please contact the TAPR office as described below.

What?

An event for the digitally-inclined ham, featuring:

- Buffet dinner (Prime Rib, Chicken, and Pasta)
- Keynote Address (Speaker to be named)
- TAPR special interest group meetings
- "Birds of a Feather" gatherings

When?

Friday evening, May 17, 2002
Doors open at 7:00 pm; dinner served at 7:30 pm
Speaker and meetings after dinner

Where?

Kohler's Banquet Center, 4548 Presidential Way, Kettering (39 40.75N, 84 08.43W), about 6 miles SE of downtown Dayton -- just off of East David Road. Detailed directions and maps are available on the TAPR web site (http://www.tapr.org/tapr/html/Fdayton.maps.html) or at the TAPR booth.

How?

Dinner requires advance registration and payment through TAPR. Tickets will be available at the TAPR booth on Friday, though we strongly encourage registration <before> Hamvention. The cost is $25.00 per person, tax and tip included.

All amateurs are welcome to attend, enjoy the speaker, and particpate in the meetings, although only those purchasing a dinner can eat.

To register, contact:
PACK*BASH
c/o TAPR
8987-309 E. Tanque Verde Road #337
Tucson, AZ 85749-9399

Phone: 972-671-TAPR (8277)
Fax: 972-671-8716
Internet: tapr@tapr.org

Visa/Mastercard Accepted

Who?

PACK*BASH is co-sponsored by TAPR -- Tucson Amateur Packet Radio, the national leader in digital communication -- and the Miami Valley FM Association, Dayton's packet radio club.

For more information (including maps), go to http://www.tapr.org/tapr/html/dayton.html#packetbash, or send email to tapr@tapr.org.

1118 separate calls relayed via PCsat through 8 April 2002. <<

Bob,

The number is higher than that since I'm not listed, and I watched my
D7A(G) succeed a couple of times. The HT was outside on the car roof and I
watched on the home APRS station moved to .825 for the pass. So it didn't
make findu. So the number is a lower limit.

Rendered body type: text/plain

```
Here are settings I have used successfully with PacComm v5.0 firmware:

MYcall N8DEU-12
MYa RELAY
UN APRS VIA RELAY,WIDE2-2
LPATH APRS VIA RELAY,WIDE2-2
LOC E 6
MYP N8DEU
CTEXT >Send reports to N8DEU@N8DEU.#HSV.AL.USA.NOAM or n8deu@amsat.org
CMSG ON
CMSGD ON
BTEXT >Send reports to N8DEU@N8DEU.#HSV.AL.USA.NOAM or n8deu@amsat.org
B E 60
TXD 30

An explanation of each line follows:

1. Mycall - you have to program a call sign unless it is N0CALL.

2. MYalias - for mobile operation you do not need to be a RELAY
    unless you want to be one.

3. UNproto - unproto path used for BText packets. All BText data
```

will be transmitted using this APRS routing path.

4. LPATH - this is the unproto path for location beacons. All location beacons will be transmitted using this routing path.

5. Loc Every 6 - the programs the beacon rate in 10 second increments. In this case, 6 equates to every 60 seconds

6. MYP - sets the callsign for the internal PBBS. This is not necessary unless you want to activate your PBBS.

7. CTEXT - this is a message sent to all stations that try to connect to my TNC.

8. CMSG ON - instructs my TNC to send the CTEXT message if somebody attempts to connect to my TNC.

9. CMSGD ON - This instructs my TNC to disconnect anybody who attempts to connect to my TNC. This is UI packet and I do not want anybody to connect to it and tie it up being busy with a connection. Since I do not use the PBBS, there is no need for a remote connection so I make sure they cannot stay connected and prevent my beacons from being transmitted. Anybody attempting to connect to your tracker is being a nuisance.

10. BText - this message is a status message I transmit for information purposes. It must be preceded with the ">" if you want Kenwood radios and some APRS software to see it as a status message.

11. Beacon Every 60 - this sets the BText to be transmitted every 600 seconds or 10 minute intervals.

12. TXD - sets the transmit delay time to insure the transmitter is engaged and the frequency has stabilized before sending any packet data. It should also be long enough to allow systems that have a slow squelch circuit to open so they too can capture your data.

If your GPS transmits $GPGGA sentences through its serial port you can use the default setting for GPSTEXT which is $GPGGA. This instructs the TNC which sentence to load in the LTEXT buffer. This can be changed to grab other NMEA sentences, but it must be set to something that your GPS transmits, otherwise the TNC will not transmit a location beacon.

If your GPS transmits a $ sentence GPGGA you can leave the GPSTYPE set to the default of 1. This setting instructs the TNC to check for the string type that is entered into the GPSTEXT entry. There are other settings, but without knowing what GPS you are using there is not enough information to proceed with this topic.

You can also program LG1TEXT, LG2TEXT, or LG1TEXT to grab other NMEA sentences if desired. LG1TEXT defaults to $GPVTG.

If you need to send an initialization string to your GPS you can use the GPSITEXT setting

Make sure the baud rate of your GPS matches the baud rate of the TNC serial ports setting.

You will have to issue a GPS ON command at the CMD: prompt before removing your serial cable from the TNC and connecting your GPS to the TNC serial port. If you attempt to talk to the TNC with your computer at this point it will not listen until you send a backslash "\" or the symbol set in the GPSEXIT setting which defaults to "\".

Just plug your GPS into the serial port of the TNC and you are ready to roll.

I hope this helps you with your tracker using the PacComm version 5.0 firmware. There are many other settings that can used, but these are the basics for using the TNC as a Tracker.

73's,

Tim - N8DEU
Huntsville, Alabama

Has anybody had their memory battery go low and what did
you have to do to fix this. Garmins web site claims it will cost
$89.00 to repair it.

Did anyone have this happen and how did you fix it?.

```

```
Was talking to my dad (kr4ft) last night about smart beaconing and he had one
heck of an idea.  Poor man's smart beacon.... tie the CD pin to the brake
lights in your car.  Each time you hit the brakes the TNC thinks the channel is
clear, and if it wants to will TX a posit.  Of course you need to wire a 555
timer to the TX inhibit line so that you get a TX "all clear" every 3 minutes
or so whether you hit the brakes or not.

This could add smart beaconing to many "dumb" devices like KPC3's and MIC-E's...

It's a 'sealed' unit that has to be opened.  I suppose you could open
it yourself, but you wouldn't be guaranteed to maintain the integrity
of the seal when you closed it back up.  The GPS II+ is 'dunk proof'
up to I think 10 Meters.  (If it's deeper than that, are you going to
get it back anyway?)

Bill, you should call Garmin and ask them directly. mine went bad
a few months ago, and they replaced that battery for free. Seems they had
a batch of bad ones and they're honoring a longer warranty on them. I
think it was 5 years, but you really should call them to ask.

It has been brougt to my attention that the url I sent was missing the f in
findu_credit_list.htm. That is what I get for sending email from work. I
created a duplicate page with out the f. I have not added links on the two
other paged just yet but it is on the list of things to do. All 4 urls are
listed below. The list does not include what the TAPR office has. They are
planning the trip to Dayton for Hanvention and I will get them from the
office manager then. Sorry for the error. Been trying to rebuild a clients
pc that crashed on saturday. It helps if they bring all, and I mean all, the
software and driver disks the first time.

According to the PC SAT live web page, there's been no one
uplinked to it within the last 12 hours or so, aside from
an Italian station.....what's the problem ?
I'll go back to the BBS frequency in my area if it's gone
on the blink again.

Rendered body type: text/plain

Well, I had time to do a bit of investigating re: the local WX station
(N2UEM) that does not always appear on my APRSdos screen.

To recap: I see plenty of packets each hour (8 to 12) but seldom see the
icon on my screen.

I had some time today to watch the raw packet screen. I found he's running
the Macintosh version of APRS. I also thought (but not sure) that I saw
two different WX formatted packets. One *with* a time stamp, and one
without a time stamp. The one without a timestamp is the only one that
shows up on my APRSdos screen.

The timestamp with the other packet is for the correct day and time, but
APRSdos converts it to UTC and so it becomes 4 hours old and fades the icon
out.

Is this a problem with my program, his program, or his computer clock
setting, or ......??

Whoops! Correction ... the "non-time-stamped" packet is not a WX packet.

It is a station ID packet with *no* WX information ... however, once I
received *that* packet *then* the WX info previously received is assigned
to it and I see the icon. I understand Mac / Windows versions send this
'second type' of packet when running WX mode, as opposed to the single
APRSdos WX packet. But this 'second' packet is not sent as often, I think,
as the WX packets are.

This is why I never liked the positionless weather packets...  They are
useless without a position too...  MacAPRS only sends a position once
every 30 minutes or so.  If you miss one or two of these, then it could be
an hour or two without a position.  Meanwhile the WX data is useless.

If your network is busy, and in an hour-or-two the MacAPRS station could
be bumped off the bottom of the Positions list as old.  Then the next
positionless WX packet comes in and there is no position to assign the
data to!

APRS was designed to be a REAL-TIME system with each packet being
complete and without dependence on any other packets or prior knowledge..
It does not make sense to wait 30 minutes to an hour to find out where the
WX data is supposed to be plotted...

Not only APRSdos, but all the Kenwoods, and HAMHUDS and any other system
with limited memory has the same problem with Mac/Win weather data.
Weather data transmitted in the positionless format is often of no value
because there is no position data telling the end user where it is...

APRSdos uses the original "complete" weather format that stands alone.
Although it includes 16 characters of position overhead in each packet, it
does not then need to send an additional 100+ byte POSIT packet every 30
minutes.  Thus, it is complete at all times, and it uses less channel
```

bandwidth.

184. [aprssig] PCsat Power management

From: Bob Bruninga <bruninga@usna.edu>
Date: Wed, 10 Apr 2002 13:33:37 -0400 (EDT)
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-73246-2002.04.10-13.07.32--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

Here is a summary of power demand on PCsat:

PCsat low power mode saves us about 35% from RESET mode. But with some aggressive commanding during this last power minimum we found an additional 14% savings by turning off all periodic packets except the bare minimum.

We don't lose anything, because I have modified our PCSAT Command program (running on all continents) to transmit the BULLETINS and STATUS from the ground. Thus, the users on most continents still see the current status, but PCsat then does not keep sending them over the other 90% of its orbit where there are no users. These packets will look like this:

   OPS-min. No dark ops please. Command Stn sends.

Here are the numbers which show the whole-orbit average power required to transmit each kind of packet... Remember there are two TNC's and both are dual port, and both can be crossconnected to both transmitters in fail-safe mode (RESET). When crossconnected, transmit power is doubled.

```
 PACKET      1200/9600  DEFAULT X-CNCTD NEW-PLAN  FINAL
 ----------- ---------  ------- ------- -------- ------
 A-TLM every  1/3 min   13 ma    26 ma     1/0   10 ma
 B-TLM every  3/1 min   13 ma    26 ma     1/0   10 ma
 A-BText      3/3 min    7 ma    14 ma     5/0    4 ma
 B-BText      3/3 min    7 ma    14 ma     5/0    4 ma
 A-BLTNS    4@6/6 min   13 ma    26 ma   1@6/0    2 ma
 B-BLTNS    4@6/6 min   13 ma    26 ma   1@6/0    2 ma
 --------------------   ------- ------           ------
 TOTAL XMT LOADS        66 ma   128 ma           32 ma

 UHF RX's               70 ma    70 ma   off      2 ma
 TNC/RX fixed load     140 ma   140 ma   on     140 ma
                       ------   ------          ------
 TOTAL LOADS           276 ma   342 ma          174 ma
```

User load only occurs over about 10% of the earth, so if user demand about equals the ALOHA standard of less than say 20% when over the HAM populations, then the user load is less than 5% of total power budget. Over the USA, user demand is on that order. But I dont know what it is over Europe.

If someone in Europe wants to add up the average user packets-per-minute over a pass, this will help us guestimate how best to manage the user load. Dont send me files, just count packets per minute (not counting PCsat's own packets).

If User load is low enough, we might be able to go back to night ops..

```
Of course, that would only work for those people that drive a vehicle with
automatic transmission, who actually need to brake for their vehicle to slow
down. Standard transmission drivers shift down (or just release the gas
pedal) to slow down, and only break if that's not enough...

In the end, it's probably more work and more expensive to connect a 555 to
the break light than it is to build a TinyTrack-2... which gives you "real"
smart-beaconing.

         I use one to connect to my UPS (it's a serial unit) and it works fine.

         Anybody know if you can use more than one?  I'd like to have 4
serial ports, but only have 2.  Two TNCs and the UPS take all the serial
ports I can muster, and I still need one more for another device.

         Thanks,
         Earl

You can use as many as you have open USB ports for. I have used 3 at one
time without difficulty.  (MCT version on Win98SE).

The only problem I have ever had (and still do) is that after a reboot, the
USB > Serial Com Port numbers change...every time. It could be com 4, 5 or 6
depending on the reboot. It doesn't change the fact that they work, but
after each reboot I have to reconfigure the software that is using the port
to the "right" port number. Annoying, but I can live with it given I now
have a virtually unlimited number of serial ports....IF the software you are
running recognizes all the Windows available serial ports and has not built
into the software an artificial limit like no higher com number than
4....which some software does. I think at tone time WinAPRS supported up to
8. APRS+SA definitely supports higher port numbers. 73

Up to the limit of your USB port(s)/hub(s) to source operating current there
should be no reasonable limit on the number.  I have used two of the Purple
Computing adapters along with the original physical serial port on my laptop
with no problem.

[ I actually ran APRSplus with a KAM TNC on the original serial port,  the
SailSoft GPS simulator running in the same PC coming out of the first
USB-to-serial port connected via gender-changing null-modem to the second
USB-to-serial feeding the simulator into the GPS port of APRSplus. ]

Bear in mind that

1)  The USB-to-serial converter is an active device (there's actually a small
single-chip computer inside the DB9 connector) that draws 5VDC power from the
PC USB socket or hub it is plugged into.   This is in addition to power
consumed by the expansion hub itself (if used).  If you have a powered USB
hub (the kind that has a wall-wart to provide DC current for each output)
there should be no problem.

2) Most of the serial ports created by these devices will have identities
ABOVE COM4,  making them inaccessable to DOS and older 16-bit (Win 3.1-type)
Windows programs.
    Any proper native Win32 (i.e. Win95/98/2k/XP) program should have no
problem with high-order COM ports.   This is an issue of whether the setup
menu within a particular program will allow you to see and select a comport
higher than COM4.

Here is what I've processed to date. I am keeping it public so that
everyone knows what is going on.
I might add that the following is ONLY what I have processed, not any
mail-in or any other form I was not involved with.
This is what I've sent in to the Denton County Amateur Radio Association,
after collecting donations via Pay Pal and my secure order form....
(Guy, the last two checks are probably still heading that way)

Check # 2800	$518.60
Check # 2802	$320.00
Check # 2803	$240.00
Check # 2805	$95.00
Check # 2812	$135.00
Check # 2818	$175.00
Check # 2820	$225.00
Total:	$1708.60

I did not understand your email in regards to TAPR delaying a payment from
collections they have received until Dayton?
Did I not understand correctly? If there is a delay, what possible reason
is there for that? You have a lot of people out here that assumed a back-up
server - solely for backing up Findu.com and nothing else - was needed and
they joined forces to get this done in a timely manner in the event the main
server croaked

Jim

Oh yeah, did I win a prize? :)

> Windows programs.

Not necessarily...  Although the interrupt sharing for ANY IRQ in DOS is
a touchy problem, there's nothing that says COM1 through COM4 are it.

When USB installs a com port, it also activates a 'virtual' IO address.
There is nothing to prevent a 'bios' implementation of USB from putting
these addresses into a 'trap list' and making the com port appear anywhere
that the BIOS allows to be set to.

Oh, and while early BIOS setups had only 2 com ports (with slots for 4,
since the cards DID have a secondary address) a LOT of your DOS
com utilities supported 8.  (Although software like ProCom wouldn't
let you use IRQs on the secondary interrupt controller, it would work
with to COM8 just fine.)

Bottom line is there really is no such thing as a '2' or '4' com port
limit in DOS.  Whatever yardstick is chosen to measure and come up
with those numbers (ie 2 or 4), another way of looking at that same
yardstick can show a different number.

In the specific case in question, the only real response is to say "Try
It"
and see what happens, under DOS that is.  It really depends on how
(or even IF) the BIOS sets up the serial ports on USB and virtualizes
them.

But by the same token, there is no 'defined standard' that lets you go
beyond just 2 com ports in DOS.  Exceptions to operation quickly
step in, mostly due to interrupt sharing.  Which, as you implied in your
post, goes away in Win9x.

Mike

```

```
A LOT of times this 'rolling' of the resources is due to the reset leaving
the resources still viable when the BIOS does it's resource scan.

For example, you have a card that is COM2.  When the machine reboots,
```

the BIOS finds COM2 because it wasn't reset 'out' of the resources. So
when the USB is scanned it puts it in COM3. Next reboot, the scan
finds COM3 and COM2 is open so the USB is now put in COM2...

The problem is that BIOSes generally do a 'resource scan' without doing
a 'hard reset' when you reboot. If you do a hard off of the system, the
com ports should probably come up the same way every time. Or if
you intercept the Windows reset or shutdown vector and kill the resources,
then this shouldn't happen.

Mike

Can't get into details, but there are three in jail, some of my stuff has
been recovered (but not the vehicle) and more warrants are to be served in
the next 24 hours.

It is a direct result of the one APRS hit. When all the arrests are done,
and my Suburban declared lost or recovered I'll give you the exact details.

Dumb crook (what does this button do) + meth + APRSSIG = Go to jail.

Thanks to all that helped!

Dave

I wasn't even going to get into the IRQ morass. I was only commenting on the fact that virtually all COMport-using DOS apps (for example the AEA PackRatt pgm, Kantronics Kanterm, etc) I have ever seen only offer the classic COM1 thru COM4 choices in their setup menus (Procomm was a rare exception!). A surprising number of Windows-based ones that should "know better" ; i.e. Kenwood's radio setup utilities, a supposedly 32-bit GPS handler for MapInfo, HyperTerm in direct-to-COM mode, Street Atlas before ver 6.0, etc also have this setup-menu-imposed limitation.

I hope the BOZOs don't know HOW
they got fingered.....

We need to keep THAT a SECRET.

Rendered body type: text/plain

I have been out of APRS for about a year now and need some help with a problem. Last night, I hooked up my GPSIII to my TM-D700A in my truck. Everything seemed to work except for one thing. The radio is not sending incoming station positions to the GPS. I have the GPS set to interface with NMEA and radio also. The GPS is sending my position to the Radio. I tried another GPSIII and cable and it did the same thing. I took both GPSIII's and cables and hooked them to my TH-D7A and both GPS's were receiving station positons from TH-D7A. This leads me to believe that the GPS's and cables are okay and the problem is with the radio. I them hooked my laptop running Winaprs 251 to the radio thru the DB9 port and was receiving incoming radio positions on the screen with no problems.

Does anyone have any idea what might not be setup correctly to cause this problem? Any suggestions as to what to look at?

Thanks
Woody

200. [aprssig] Does $GPWPL work with GPS III (not plus) ?

From: "Andreas Junge - ATT" <n6nu@arrl.net>
Date: Wed, 10 Apr 2002 18:51:45 -0700
To: "TAPR APRS Special Interest Group" <aprssig@lists.tapr.org>
Message-ID: <LYR842-73353-2002.04.10-21.25.28--lyris.aprssig#tapr.org@lists.tapr.org>
Rendered body type: text/plain

All,

I tried to upload Waypoints to my GPS III using the $GPWPL sentence but the waypoints do not show up. Any ideas? And yes, the cable works bi-directional when uploading new firmware (Version 2.10).

Thanks,

Andreas, N6NU

Rendered body type: text/plain

Okay, since we know that APRS can help catch the bad guys, I've got a question.

Does anybody have a suggestion for a low profile or inconspicuous antenna? Obviously my big ol' comet on the back don't get it! I can hide the GPS on the bottom of the plastic luggage cover and it still works fine, but I would like to put a 2 meter antenna on (or in?) the car that would give decent coverage without attracting too much attention. Unfortunately one of the many glass mounts won't work because of the spacing of the defrost wires in the back glass.

Rendered body type: text/plain

HI folks,

I have a remote Peet Bros U2K weather station running 24/7. I need to put

```
the TNC, HT, and U2K in a permanent enclosure. The wx station is located on
the coast of the Pacific Ocean and has salt air which is corrosive. Anyone
got ideas for an enclosure. Here is what I am using now, clearly a
cardboard shoe box is a temporary solution.

http://w9if.net/iweb/torreywx/P4050003.jpg

thanks,
Rich Parry

StiCo makes a wide variety of disguise combination AM/FM/two-way antennas that replace the regular AM/FM whip. They come in versions for all the common VHF/UHF/800 MHz bands, and are available with bases that match the factory original whip on many makes of cars.   The main disadvantage of these antennas (that they don't have the bandwidth of conventional VHF or UHF antennas) isn't really a problem when used for the single-frequency APRS application.

Rendered body type: text/plain

On the topic of serial port assignment. I use a 2 port PCMCIA card on my comport-less laptop. For some odd reason Windows ME never assigns COM1 and COM2. Since a WinModem was present at COM3 the two PCMCIA ports were at COM4 and COM5 - and COM5 is pritty useless for a lot of applications, as stated here also.

I never found an answer why COM1 and COM2 are not used (no, there is no hardware on the motherboard, I checked. The traditional COM1 and COM2 I/O adresses and IRQ's are open and can even be used by the PCMCIA card). This was a problem for me since the THD7 program I had only knew about COM1 and COM2. I later found an update (http://ftp.maschlanka.de/pub/kenwood/Md7120.zip) that allowed COM3 and COM4 also, so this problem is gone now.

But at least I found how to utilize both ports. I removed the resources for both the modem and the PCMCIA cards. The I rebooted and only added the PCMCIA ports which then occupy COM3 and COM4. After this was fixed I added the modem again which shows up as COM5 now. The dailup networking has no problem with that. Now I can use COM3 and COM4 from windows (interrupt shared) or one or the other from DOS (not simultaneously due to IRQ sharing).

Maybe this trick also works with the USB adapters to move them to a more favourable port. Of course it is not quite the same, the PCMCIA card contains real uarts and not software simulated ones so the compatibilty issues as with the USB adapters is non-existent.

I hope this helps a little for USB port assignment problems too. Kind regards,

Henk.

Rendered body type: text/plain

It may be limitation of the PCMCIA card driver. PCMCIA sockets have only ONE irq pin, so it is IMPOSSIBLE to get two physical interrupts. Oh, it's easy to get two virtual interrupts, but the driver is a little more complex.
Yes, they have to do that anyway, but I wouldn't be surprised to find out that when your driver was written they just didn't want to deal with the 'figuring out' of how to handle the interaction with what MIGHT already
be present, and instead just took the simple and easy way out to 'tack on' where it's pretty safe to assume there's no pre-existing hardware to interfere.

As to no hardware on the motherboard, I doubt it. There are VERY few chipsets with no ports. They just may not be activated, that's all. And that may be another piece of the puzzle too. If you can do a PCI

scan on the hardware, not software, you could look for the ports there
but turned off. ME may be smart enough to think they may turn on.

Mike

Antenex makes a line of low profile antennas under the Phantom brand name. Their VHF antenna is only 2.5 wide by 3.5 inches tall. I've got one on the wife's van, works great and doesn't get caught up in the garage door.

I am waiting to get the checks from TAPR so they can focus on Hamvention. That is the only reason. The office is still playing catchup after the move as well. We moved a large trailer load of supplies and book stock and a Rider truck full of odds and ends. With what he have, I plan to talk to Dell next week to see if we can get a discount on the server and then place the order. This entire project has moved alot faster than some of us expected so I would like to wait until the end of April to close the donation request. Everything that Jim has sent, direct donations and Brent Hilderbrants offer, with the execption of what is in the mail box at the Denton post office has been counted and give to the DCARC treasurer for processing. The backup server is strictly for findu.com and no one else. TAPR does not want to have anything to do with the server, the DCARC is only the caretaker and will not have anything to do with it as well. I have had a few people ask about adding a few other things to the server that are Ham related. It is too early to look at those options. When the backup server is installed, I will post the url's to all the list's, see that Steve posts it and that the TAPR web site has a link. I wish I had a more defined time line on when this will occur. Things moved much faster than was expected. WIth that said, I am offically stating, April 30th 2002 is the last day to send in donations. If any arrive after that date, I will return them to the senders.

Jim, your prize for the most collected donation is a kiss on the cheek from the Amatuer Radio community. You better get a big towel, cause it might be a wet one. :)

To which Bob Bruninga wrote:

>This is why I never liked the positionless weather packets... They are
>useless without a position too...

I won't get involved with APRS *software* packages that may or may not be doing the right thing, but I would point out that *remote WX stations* such as my Peet U2K -- running without a computer -- can't output a position in the WX data packet. I need to have the TNC output the position data in a separate packet via a beacon buffer (BTEXT, LTEXT, etc). So, position-less WX packets are a fact of life.

I've set my WX station's TNC to beacon my POSIT every 30 minutes (LTEXT), trying to balance excessive packets with the need for stations entering the network to get the POSIT. I rationalize that WX reports aren't normally as time critical for a new station (if WX data is so important, why wasn't the station running 24/7?). But I'm open to other suggestions or other rationale as to the POSIT timing.

Incidentally, I have a trick to get around the delay in receiving the POSIT when I start up WinAPRS. I put one of my WX station's POSITs in my STARTUP.TXT file, so the station's icon appears immediately and the next WX packet has an icon to match to. A station coming into the network with a critical need for WX reports from certain stations could use the same trick.

73,

Ralph KC2RLM

The radio is set to beacon. I am receivimg position data from the GPS to the radio and "My Position" is being transmitted.

My problem here is that incoming station positions received by the radio are not being sent to the GPS by the radio.

```
I want to thank all that responded to my D700 problem. I have found the fix
to this problem, although, I do not understand why it occurred. The fix was
setting the waypoint setting in the menu (3-3) to SIX-DIGITs. The default
value is OFF.

Like I said, I had been out of APRS for about a year. The radio had been
setup and working when I last used it and it was sending waypoints to the
GPS at that time. When I first set the radio up when it was new I made
notations in the manual of all changes I made to settings. There was no
notation of changing the waypoint setting from the default setting of OFF
to SIX-DIGIT at that time. Yet, the radio was sending waypoint to the GPS
```

back then. Now, I must set the waypoint setting to SIX-DIGIT in order for it
to send waypoints to the GPS. This is a mystery to me and will probably
continue to be so.

Again, thank you all for your help.

Rendered body type: text/plain

Does anyone have instructions for making a interface cable from an AEA PK-88
to a Radio Shack HTX-252?

Thank you for your help,
Steve KC6WCH

Rendered body type: text/plain

Perhaps people setting up remote WX stations should have a posit packet
timed to go out simultaneously with the WX beacon. This can be done very
easily with 2 of the kpc3's 4 LT buffers and associated BLT x [time] START
[time] command. If setup properly with the start parameters set for the
same min/second, the TNC would key up one time and TX both packets with no
additional TXDelay between them.

Even with "pairs" of packets (one posit, one WX), you still run the risk of
one of them getting clobbered and not making it. In that case, I'd want the
position to go out first so at least the WX would get thru. I'm assuming
here that the FIRST packet out would be the one most likely to get
clobbered.

Wes

Ralph Milnes said: ".....position-less packets are a fact of life."

Just because an unattended WX station sends them does not mean that it's "OK" for anyone else to send them. Maybe a more accurate statement might be "That's the way the Sproul's wrote their software ... so position-less packets are a fact of life."

It's not a big deal, but I do agree with Bob that I would rather not see positionless WX packets.

PS It appears that the WX station I am having trouble seeing may not have set his GMT offset after all. He's checking on it.

I've been looking into this recently, for other reasons, and I agree. Positionless, and timestampless weather packets both make little sense to me.

Knowing that the temperature was 20 degrees nowhere in particular, and at some point in the past, is kinda useless.
I know there's an assumption that a weather packet would match up with a position packet in memory for that station, but of course weather stations may move too.

I'm working with another fellow on a KISS TNC that will also take Dallas 1-wire weather station input without needing any help from a PC, and it will send timestamped reports, with position.

I have stayed out of this for awhile, but now I can't resist..

Bob has for YEARS asked us to reduce reduce reduce reduce bandwith, make packets shorter shorter shorter shorter.. etc..

If I am stationary, my position should be sent LESS often, i.e. once an hour or maybe once every half hour.. (my opinion is once an hour). Now when someone starts up and querries the network, I can send my postition so I show up on their map..

Now, If I am transmitting weather EVERY 5 MINUTES (like a lot of the weather people want), then I am transmitting my position 6 to 12 times MORE than I need to.. That is a LOT more bandwidth than is needed.. Especially since a position is about 20 characters EACH TIME it is sent

THIS IS WHY THE POSITIONLESS WX packet was developed.. This is VERY important for HF which was important to APRS people, including Bob and one time.. (I don't know if it still is or not).

Also, the amount of data that the weather people wanted was making the packet longer and longer and longer, to the point that it was well over 80 characters, or at least could have gotten that long..

The positionless WX report is in the spec and is (currently) allowed, supported etc..
